

# PROJECTED EMITTANCE MEASUREMENTS AT FLASH

## FEL studies – February 2007

Katja Honkavaara, Eduard Prat  
Beam Dynamics Meeting, 26-02-2007

- When: FEL studies - 17<sup>th</sup> and 21<sup>st</sup> (& 22<sup>nd</sup>) of February 2007
- Where: DBC2, SEED and undulator
- Standard conditions: on crest for all accelerator modules, 1nC (22-02: SASE conditions)

About the measurements in the [undulator](#):

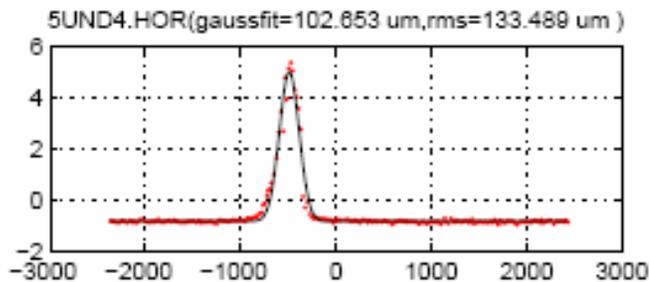

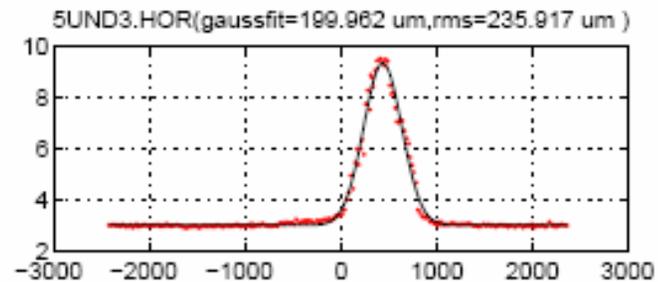

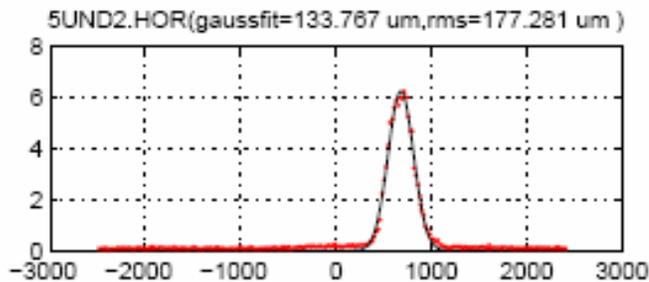

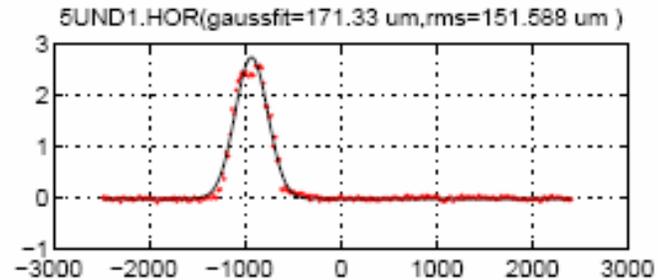

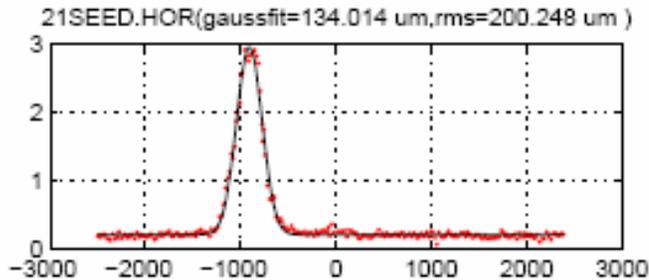

- All the measurements were done with the 10  $\mu\text{m}$  carbon wire
- New [matching tool](#):
  - It uses the toolbox from Vladimir and Nina
  - Option to limit the quad currents
  - Option to user quads which share power supplies
  - Option to choose between Gaussian or rms beam sizes

Where & when	Comments	$\epsilon_x$ [mm mrad]	$\epsilon_y$ [mm mrad]
Injector 08.47h	Matched	$3.72 \pm 0.12$	$3.78 \pm 0.07$
Seed 12.30h	Matched	$2.74 \pm 0.22$	$2.95 \pm 0.09$
Undulator 17.01h	$M_x = 1.039, M_y = 1.145$	$4.25 \pm 0.34$	$4.37 \pm 0.31$
Undulator 17.55h	$M_x = 1.025, M_y = 1.163$	$5.13 \pm 0.26$	$4.44 \pm 0.17$
Undulator 18.11h	$M_x = 1.050, M_y = 1.113$	$5.12 \pm 0.20$	$5.14 \pm 0.23$
Undulator 18.45h	$M_x = 1.031, M_y = 1.052$	$5.15 \pm 0.18$	$4.89 \pm 0.15$

**SEED section**      Similar emittances as in the injector  
 Matching worked properly

**Undulator**        Similar emittances as in the injector

# Taking rms or gaussian beam sizes: Beam profiles example (17-02)

- A gaussian fit represents well the beam
- rms is very sensitive to the beam tails

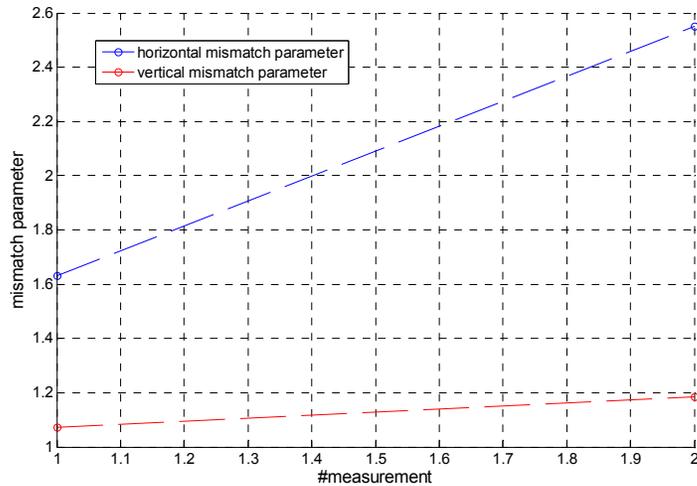

# Taking rms or gaussian beam sizes: Emittance results (17-02)

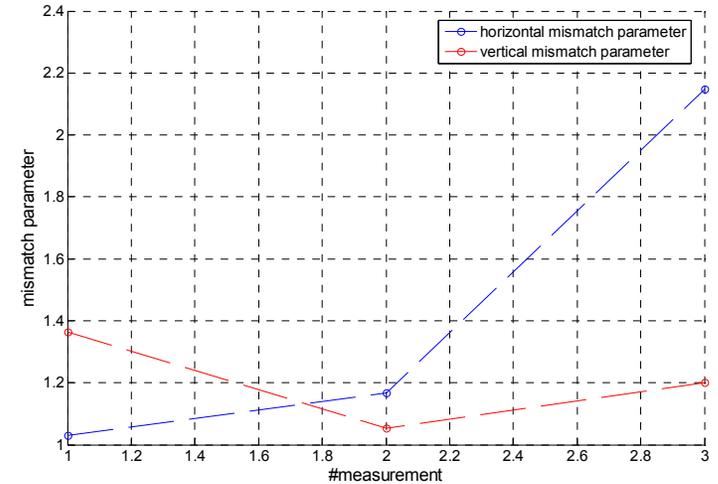

Where & when	$\epsilon_x$ [mm mrad]		Mismatch x		$\epsilon_y$ [mm mrad]		Mismatch y	
	rms	gauss	rms	gauss	rms	gauss	rms	gauss
Undulator 17.01h	4.25	3.58	1.039	1.167	4.37	3.62	1.145	1.053
Undulator 17.55h	5.13	3.84	1.025	1.021	4.44	3.86	1.163	1.257
Undulator 18.11h	5.12	4.02	1.050	1.070	5.14	4.38	1.113	1.072
Undulator 18.45h	5.15	3.56	1.031	1.053	4.89	4.22	1.052	1.017

- Emittance systematically smaller with a gaussian beam
- Similar mismatch parameters

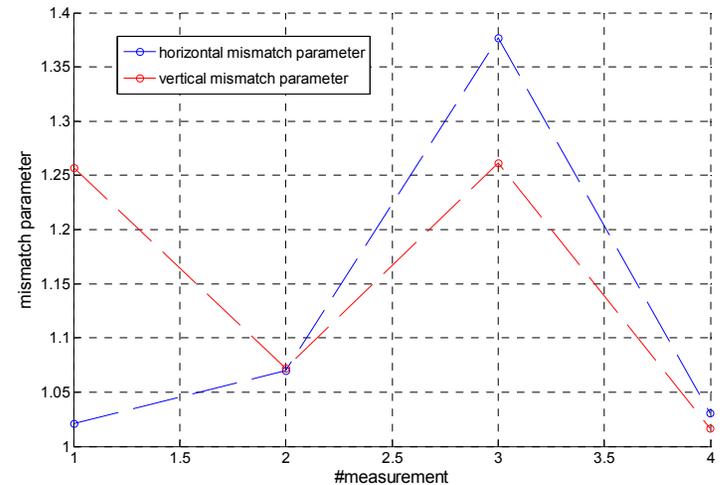

With rms beam sizes

With gaussian beam sizes

With gaussian beam sizes

- Limiting the quad current variation helps
- Taking Gaussian beam sizes instead of rms sizes helps
- Cycling should do the rest

Where & when	Comments	$\epsilon_x$ [mm mrad]	$\epsilon_y$ [mm mrad]
Injector 18.18h	Matched	$4.75 \pm 0.17$	$3.41 \pm 0.15$
Seed	Not proper measurement		
Undulator 22.28h	$M_x = 1.256, M_y = 2.073$	$4.24 \pm 0.48$	$4.43 \pm 0.66$
We started from scratch here...			
Undulator 00.13h	$M_x = 1.528$	$5.79 \pm 0.61$	-
Undulator 01.31h	$M_x = 1.342$ , corrected dispersion	$4.30 \pm 0.37$	-
Undulator 02.18h	$M_x = 1.136$ , 6 degrees off crest at ACC1	$6.28 \pm 2.39$	-
Injector 03.03h	$M_x = 3.422, M_y = 1.713$	$3.67 \pm 1.54$	$2.99 \pm 0.22$

DBC2 section  
SEED section

Big initial mismatch in the 2<sup>nd</sup> attempt

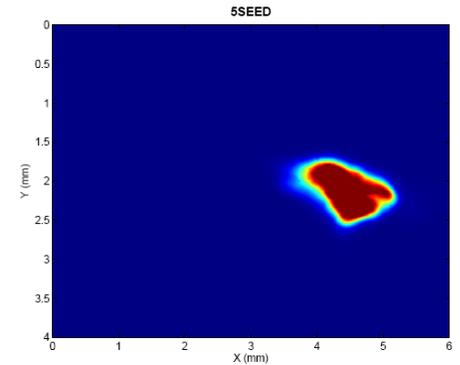

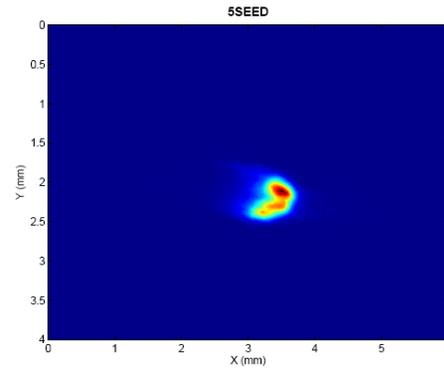

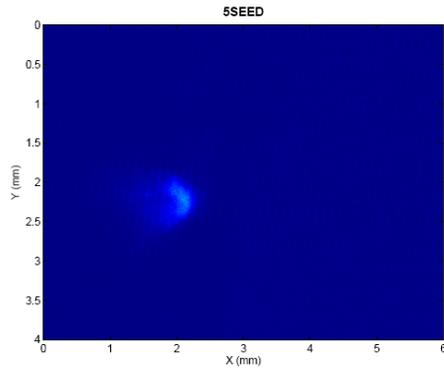

Not proper measurement since strong dependence of the beam size on the horizontal position

Matching did not work

Undulator

Imaginary calculated emittances in the vertical plane

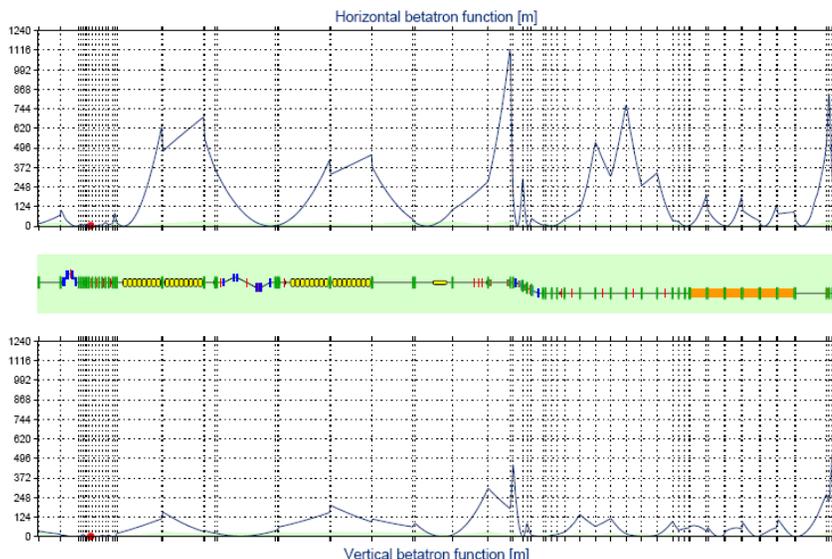

Not possible to try matching

- Strong dependence of beam intensity and beam size on horizontal position for at least 3 out of 5 screens in the SEED section.
- This has been observed only during the measurements on the 21<sup>st</sup> of February. Previously, only a weaker dependence in one screen was observed and matched worked properly.
- Possible explanation: screen and/or optical set-up misalignment?
- Further studies are required

	Beam size at 21SEED	
	$\sigma_x$ [ $\mu\text{m}$ ]	$\sigma_y$ [ $\mu\text{m}$ ]
Reference	$153.4 \pm 13.7$	$318.9 \pm 11.5$
↑Q9ACC5 by 0.5A	$69.1 \pm 17.9$	$300.5 \pm 13.0$
↓Q9ACC5 by 0.8A	$416.3 \pm 31.8$	$329.0 \pm 20.2$
↓Q10ACC5 by 0.8A	$82.0 \pm 20.3$	$291.7 \pm 8.3$

Modifying Q9ACC5 and Q10ACC5 had an effect to the beam only in the horizontal plane

	Design		Calculated from DBC2 meas.	
	$\beta_x$ [m]	$\beta_y$ [m]	$\beta_x$ [m]	$\beta_y$ [m]
Q9ACC5	14.4	24.2	452	400
Q10ACC5	13.1	26.9	94	105

Where & when	Comments	$\epsilon_x$ [mm mrad]	$\epsilon_y$ [mm mrad]
Undulator 20.49h	$M_x = 1.025, M_y = 3.011$	$8.18 \pm 0.45$	$6.18 \pm 1.34$
Undulator 21.44h	Attempt to match, $M_x = 1.163, M_y = 1.706$	$8.36 \pm 0.38$	$6.93 \pm 0.45$

Just 1 measurement and 1 matching attempt  
No time for more ☹️

## Summary

- ✓ New matching tool for the undulator
- ✗ Not proper status of the machine makes measurements very complicated
- ✗ In the SEED screens, observed dependence of the beam size on the horizontal position

## Next steps

- Further studies to solve the problematic in the screens of the SEED section: work on the alignment of the optical set-up and OTR screens ...
- Further studies on wire scanners problematic
- Improve the matching tool: include an option to modify the beam size in the calculation of the emittance ...
- Next measurements after the shutdown (with OTR aligned, wires in the SEED section ...)
