

Horizontal Slice Emittance Measurements with Lola

Holger Schlarb, Markus Huening,
Michael Roehrs

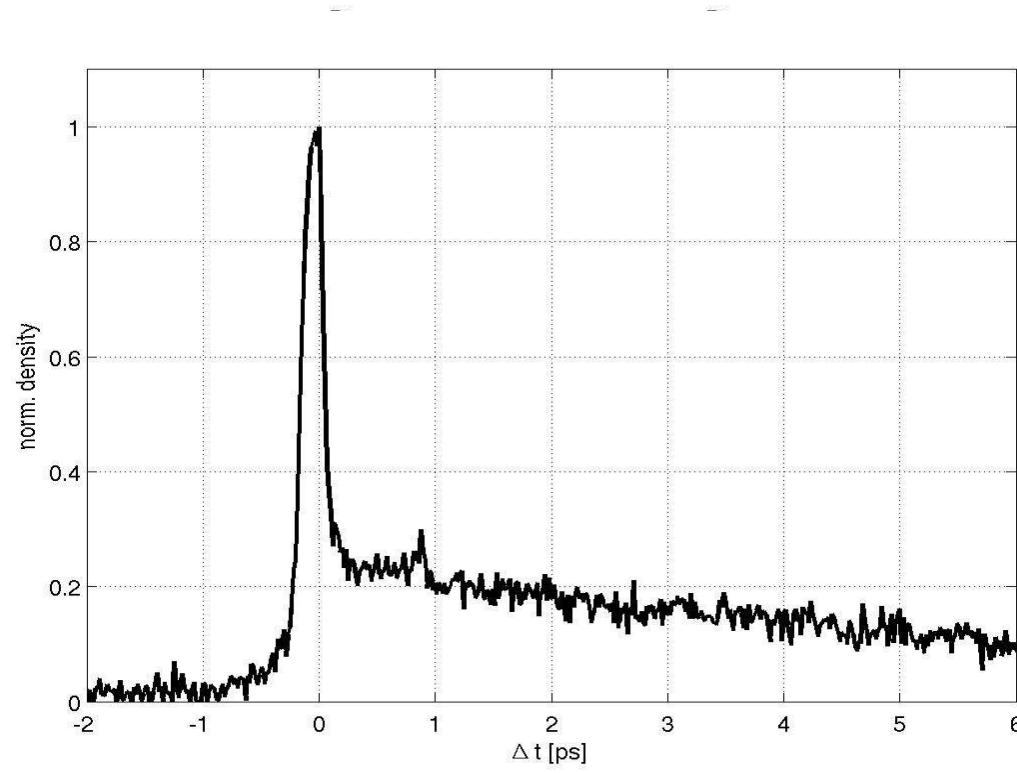

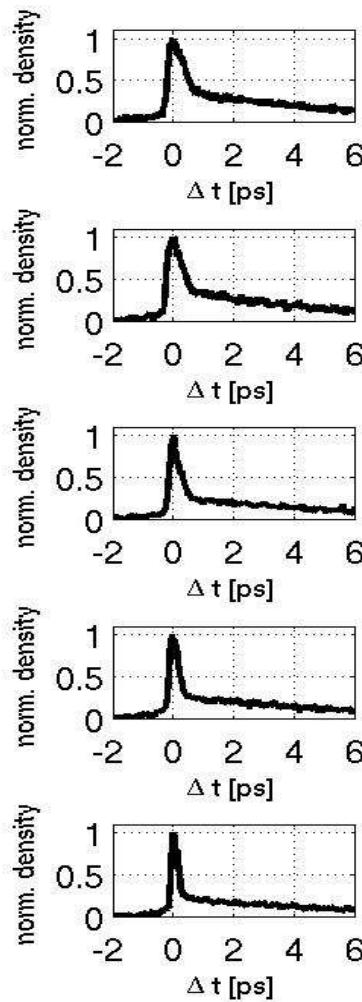

Vertically stretched bunches during quadrupole scan

Vertically stretched bunches during quadrupole scan

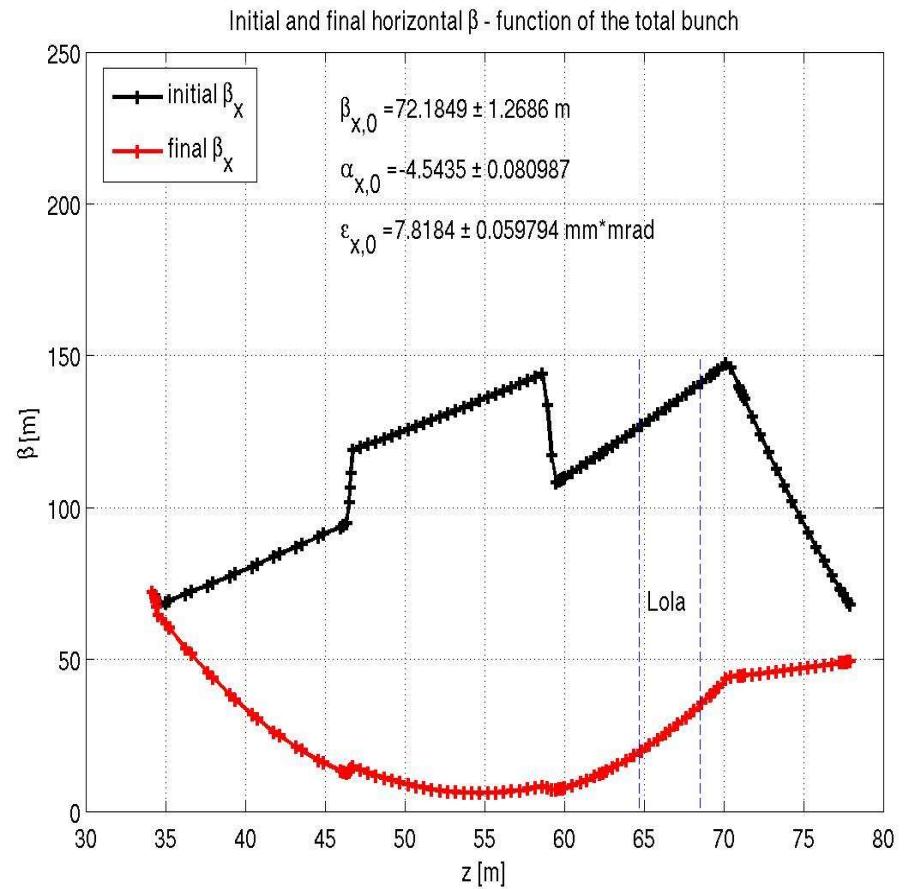

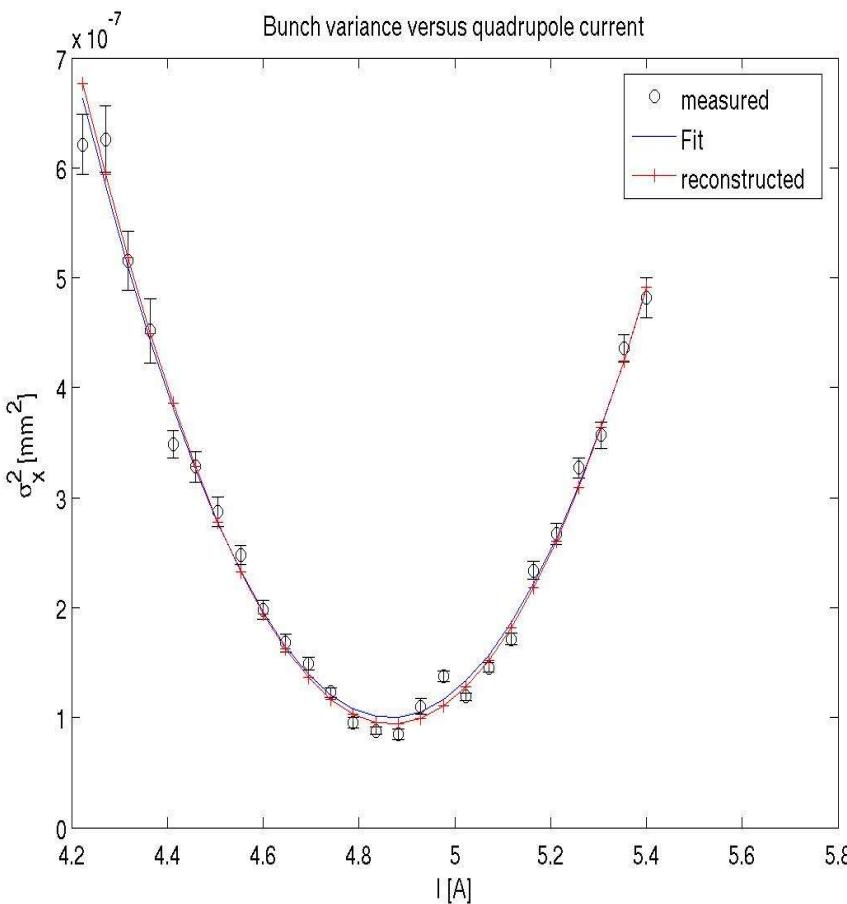

Longitudinal profiles

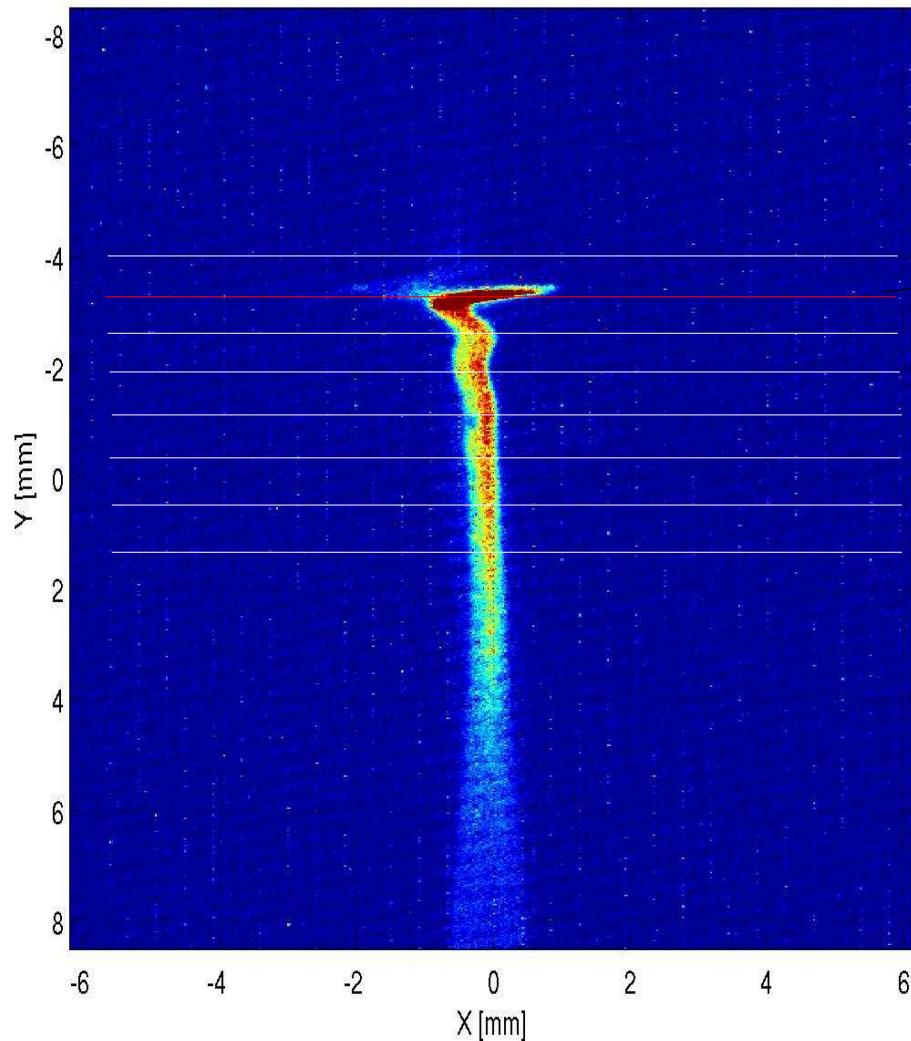

- Streak: $16.6 \text{ fs} / \text{pixel} = 0.61 \text{ ps} / \text{mm}$

Bunch emittance (100%) and Twiss parameters

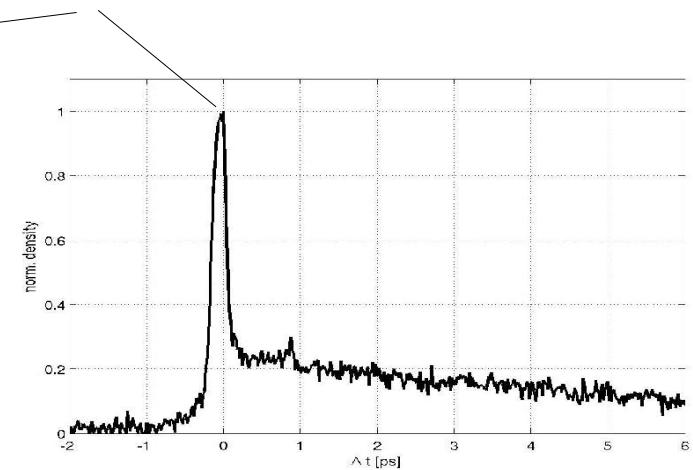

- 10 background and 10 beam images are used to determine the rms width for each quadrupole current
- only statistical errors are included

Subdivision into slices

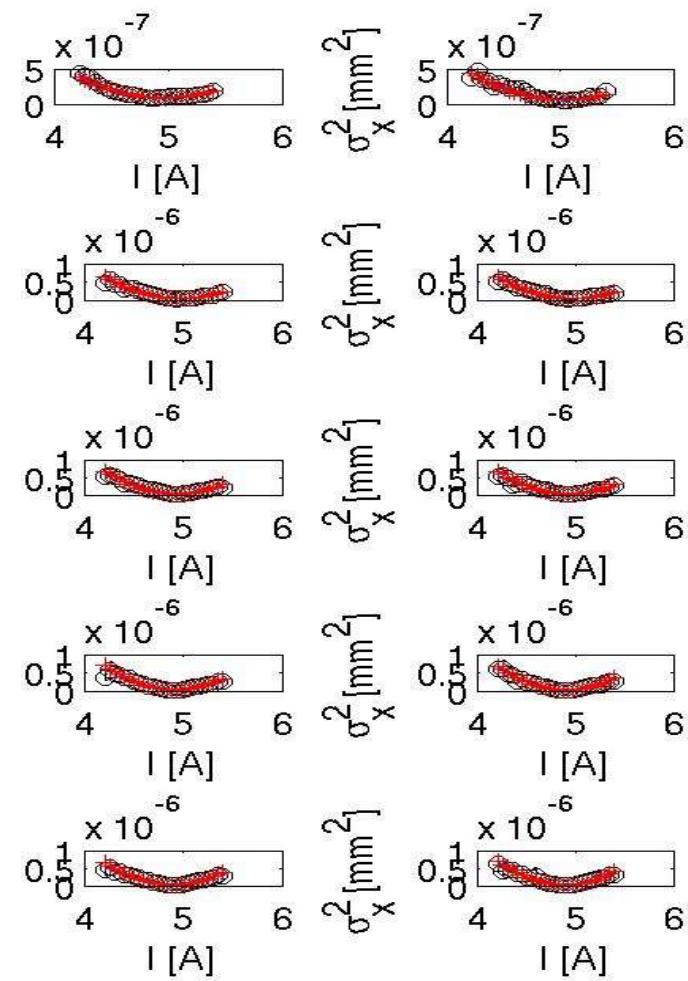

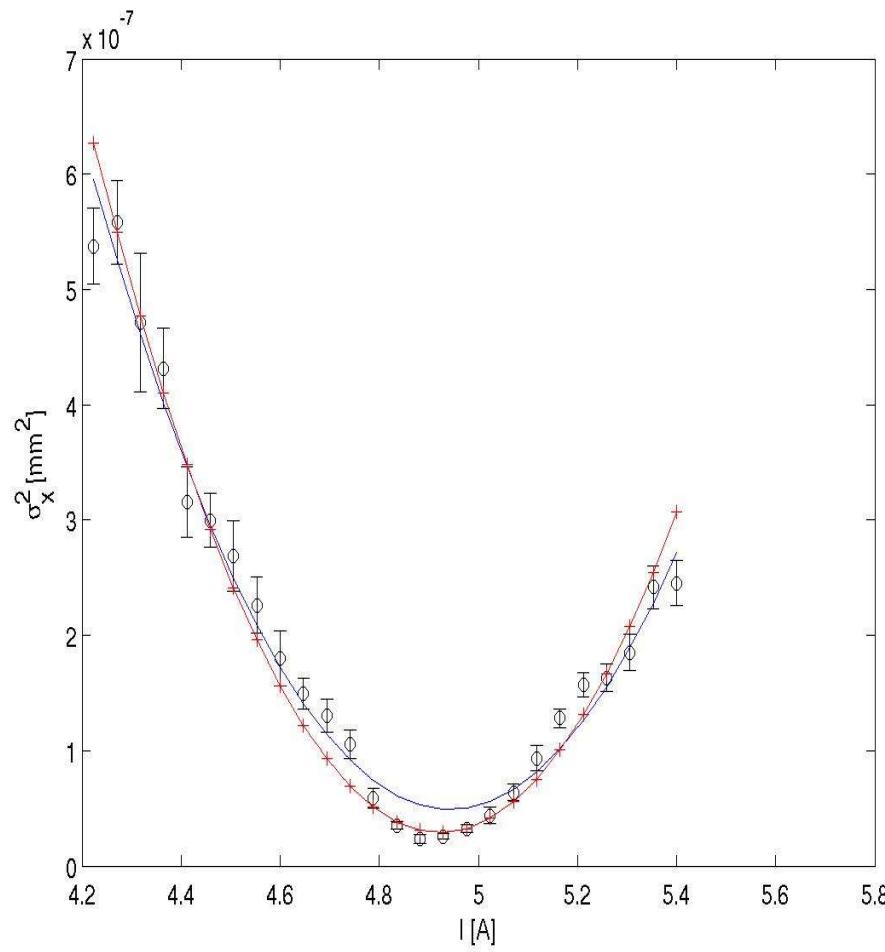

reference point:
peak in vertical
profile

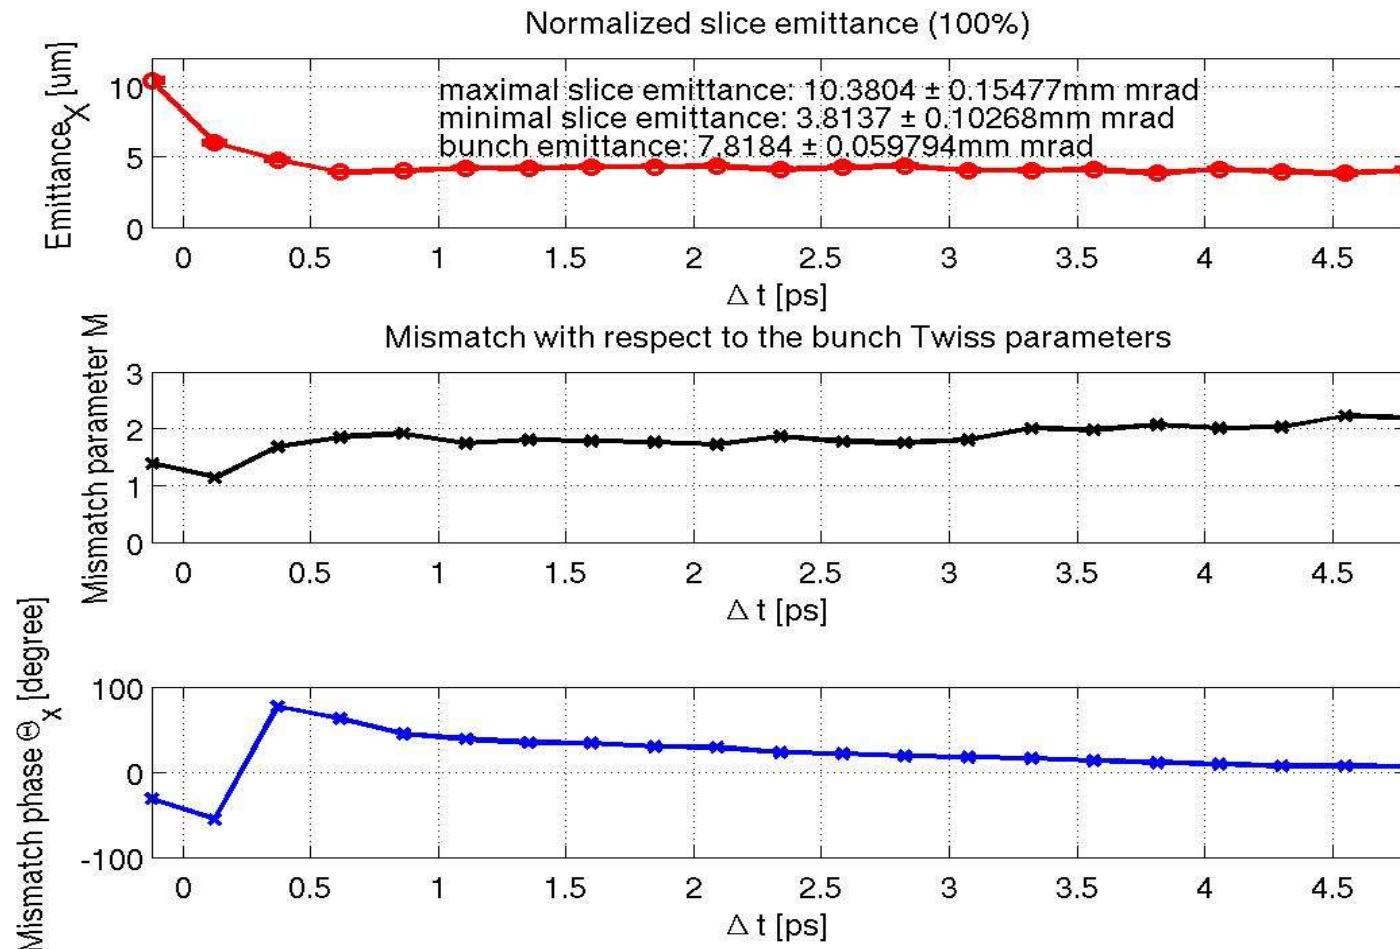

Slice width: 0.4 mm (y),
0.24 ps (z)

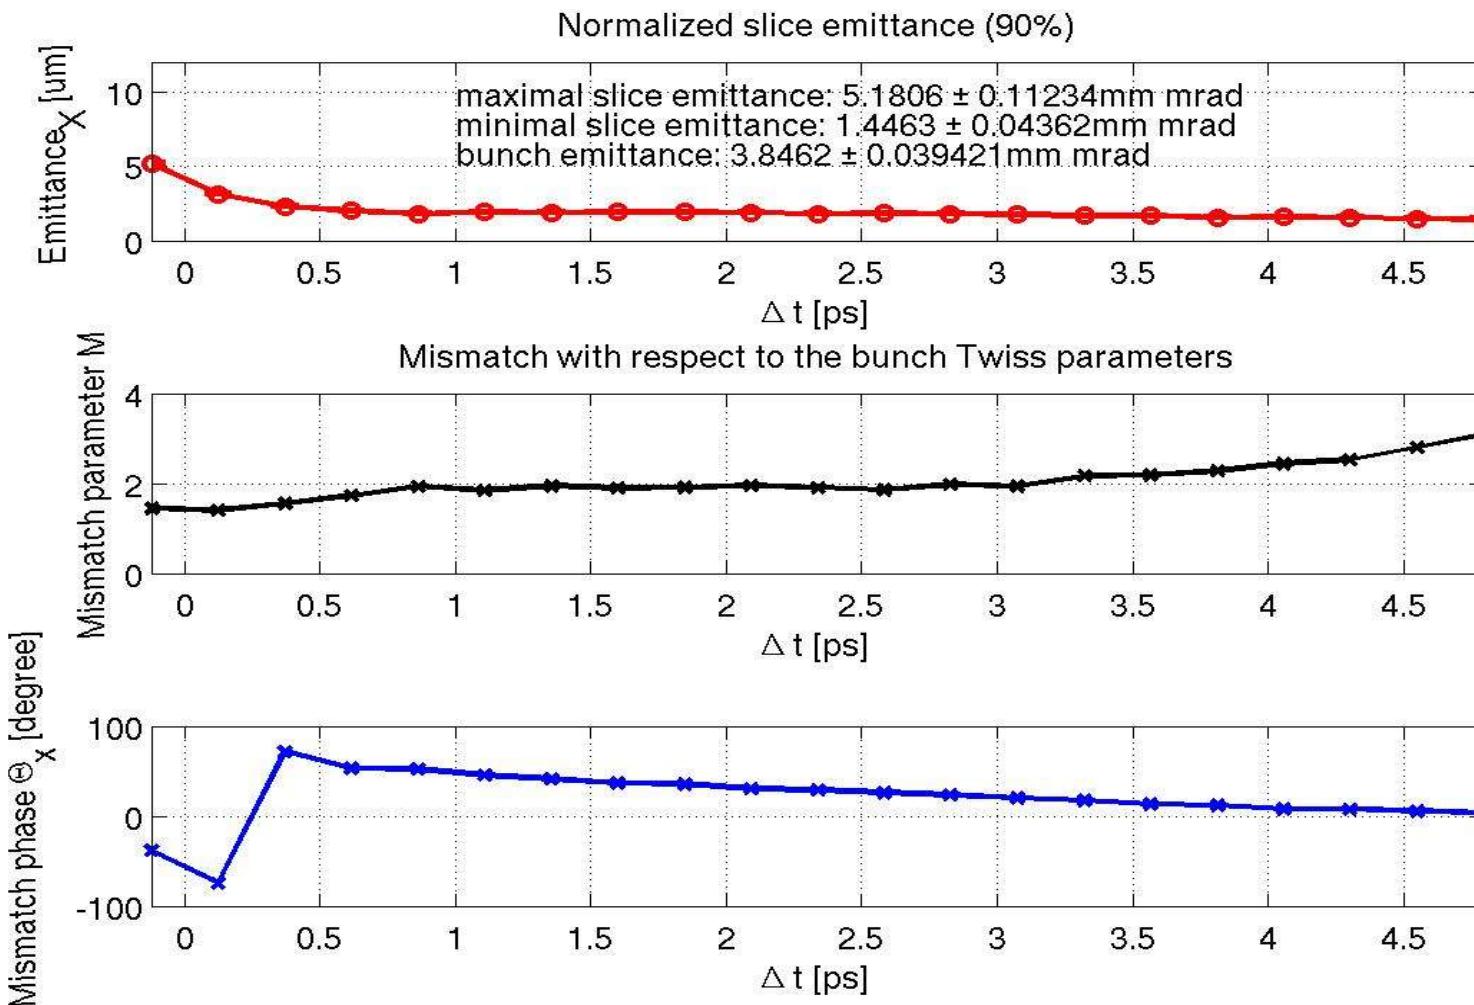

Horizontal slice widths

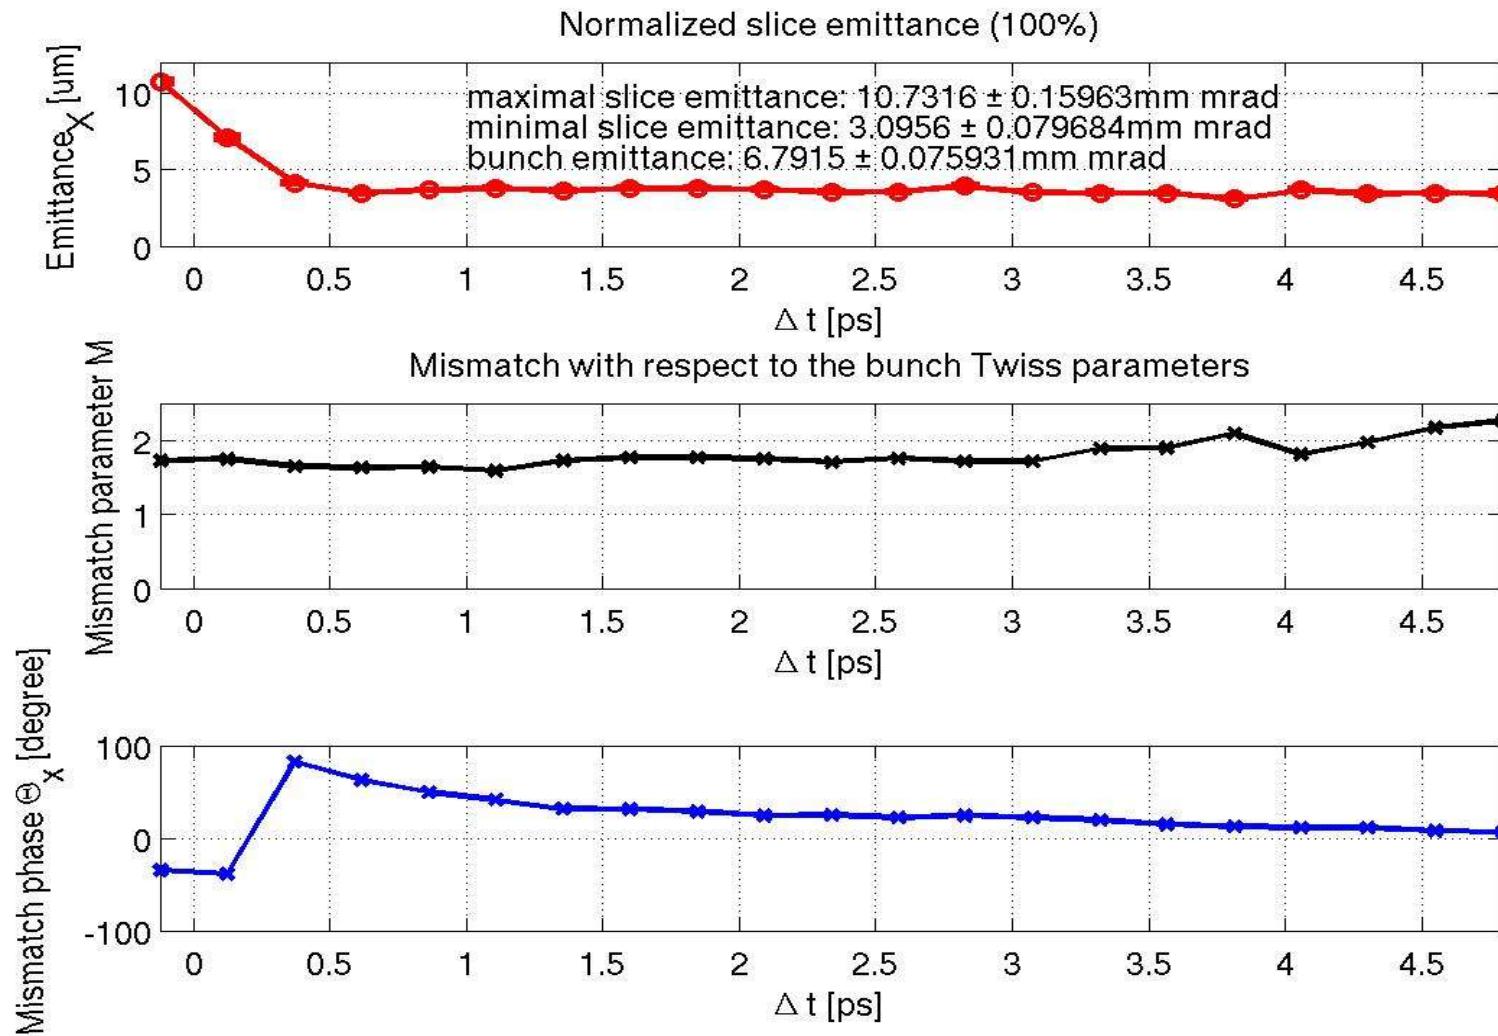

Horizontal slice emittance (100%) and mismatch

Horizontal slice emittance (90%) and mismatch

Horizontal slice emittance and mismatch (slightly different optics)

Possible Improvements of horizontal slice emittance measurements

- Measurement with fixed vertical beta function at the screen
- Reconstruction of the particle distribution in the (y,z)-plane using tomography
 - calculation of the true horizontal slice widths?
 - determination of the longitudinal resolution
