

Offline analysis status

Tokyo Metropolitan Univ.
Osamu Ota

Outline

- Comparison eta- γ free & fixed
 - Study on the eta-range dependence
 - LPOL/TPOL vs beam size
- Summary & future

eta-range dependence

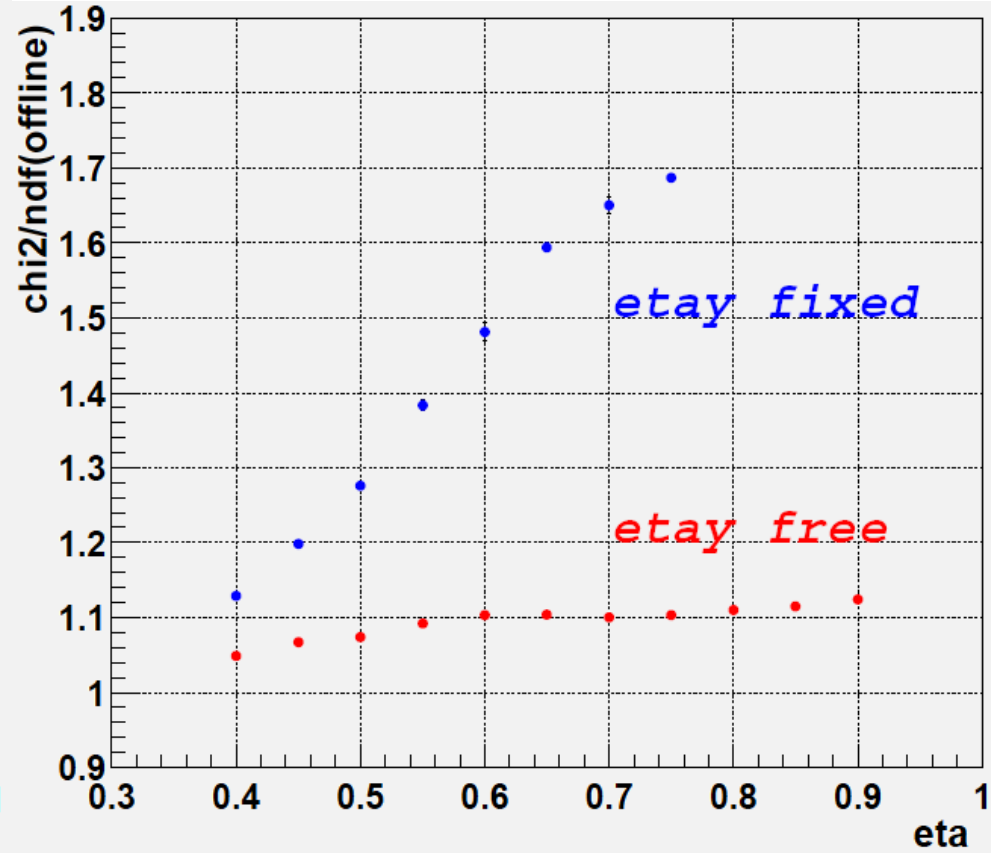

- Source of eta-y parameters
 - 1st.Mar.2004
 - 25th.Feb.2004
 - Extract parameters from silicon data.
- CAL data sample
 - 1st.Mar.2004
 - 25th.Feb.2004

1st.Mar.2004

The new offline method is unstable with eta-y parameters fixed.

1st.Mar.2004

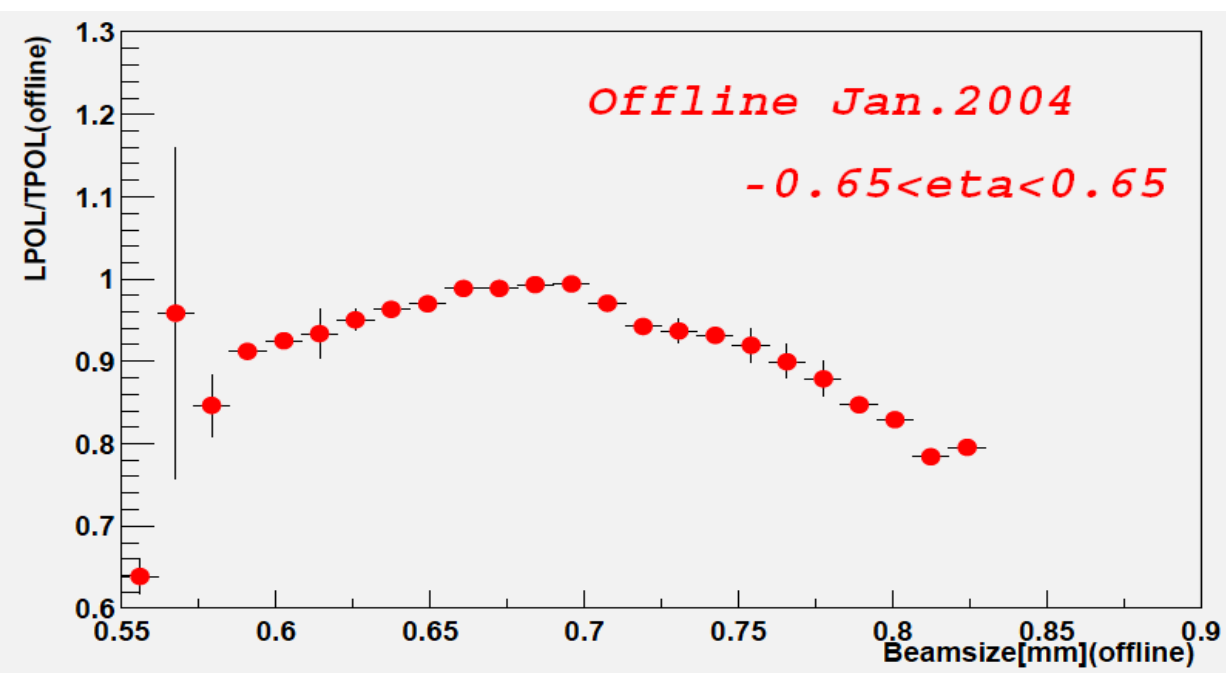

25th.Feb.2004

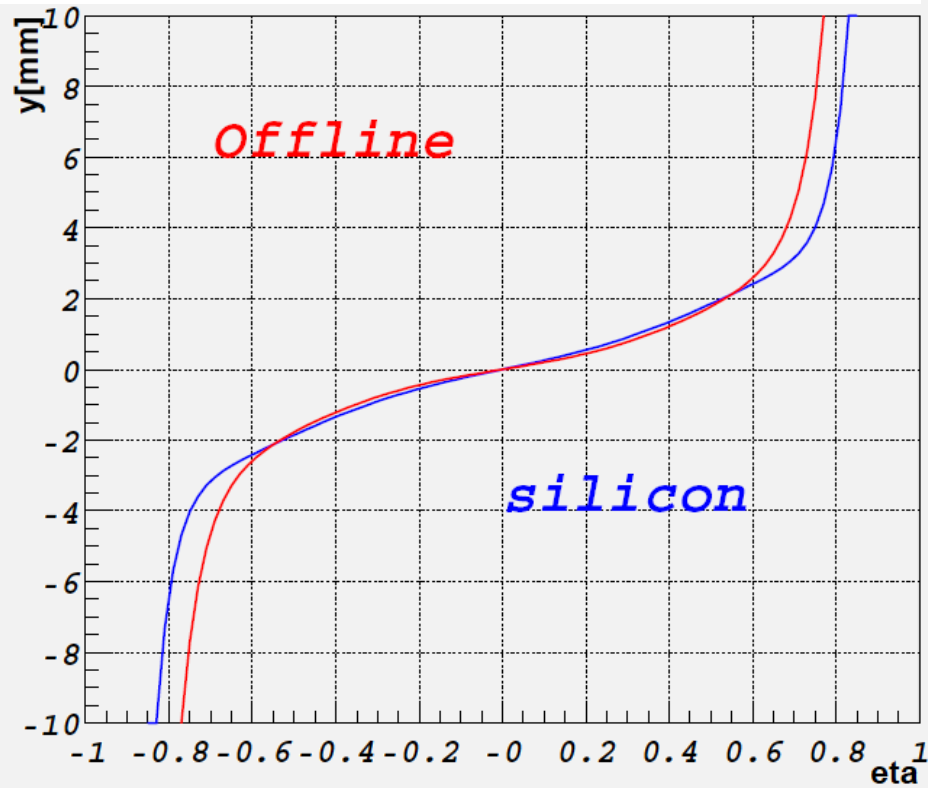

25th.Feb.2004

For both CAL data, the method is unstable.

Even when eta-y parameters are fixed, the new method can not absorb beam size dependence.

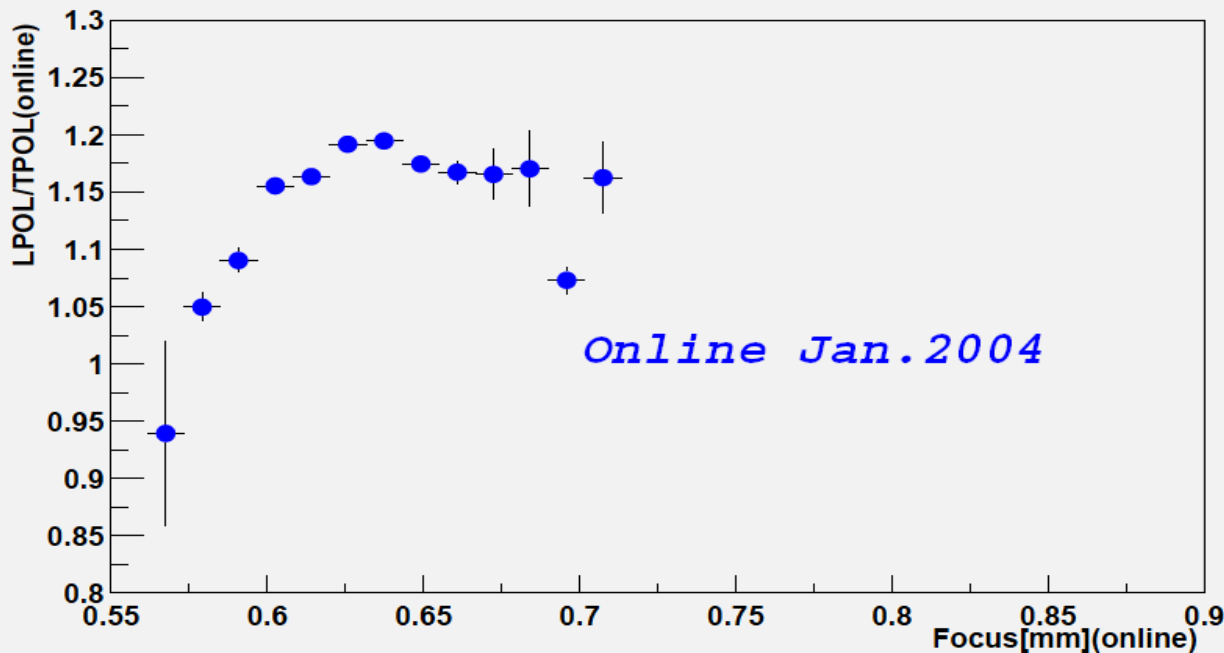

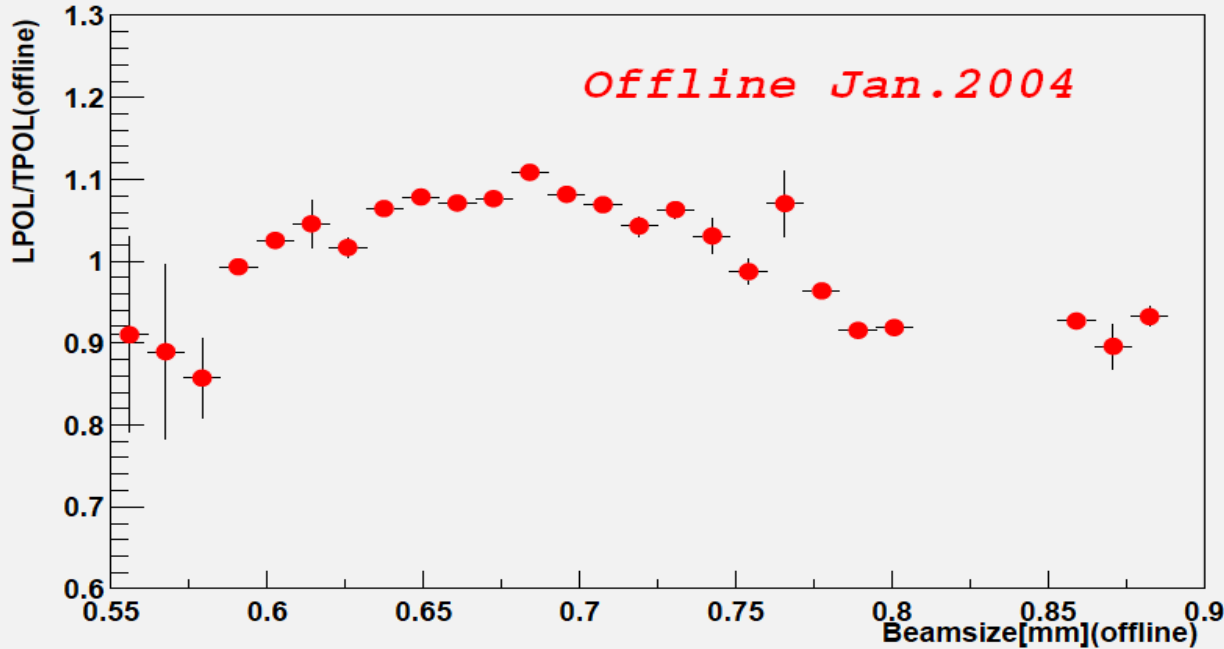

In all η -range, these two curves are different.

That seems to cause the instability of the method.

→ Try to table scan, and needed more study.

Summary & Future

- The new method is unstable even when η - γ parameters are fixed.
- In both cases, these parameters are fixed and free, there still exists beam size dependence.
- Is it necessary to fix other parameters? \rightarrow which parameter?
- To check stability with table scan.

With eta-y free,
the new offline
method can not
absorb beam size
dependence yet.
