# Silicon detector <br> alignment study review 

POL analysis meeting
$15^{\text {th }}$ December 2004

Catherine Fry
Imperial College London

## Outline

- Data
- $x-\eta$ slope
- fit beam ellipse to silicon data
- MC
- tuning parameters
- vary cal angle w.r.t. beam for fixed silicon angle
- Compare data and MC to extract siliconcalorimeter angle

## $x-\eta$ distribution

Compton only
August 11 ${ }^{\text {th }}$

- This distribution should be flat if silicon and calorimeter are perfectly aligned
- But we see a slope of $-1.3 \mathrm{~mm} / \eta \rightarrow$ suggests some angle between the two detectors
- Will use MC to find which angles for silicon and calorimeter w.r.t. beam give the same slope

## Beam tilt measurements

- Measure beam tilt w.r.t. silicon detector
- Fit 2D ellipse to backgroundsubtracted data
- See that beam tilt changes over time:

| $1^{\text {st }}$ March | $6.8 \pm 0.3^{\circ}$ |
| :---: | :---: |
| $7^{\text {th }}$ March | $4.6 \pm 0.1^{\circ}$ |
| $24^{\text {th }}$ May | $3.0 \pm 0.1^{\circ}$ |
| $8^{\text {th }}$ July | $3.4 \pm 0.3^{\circ}$ |
| $9^{\text {th }}$ July | $3.4 \pm 0.5^{\circ}$ |
| $12^{\text {th }}$ July | $3.4 \pm 0.3^{\circ}$ |
| $13^{\text {th }}$ July | $4.7 \pm 0.4^{\circ}$ |
| $15^{\text {th }}$ July | $3.5 \pm 0.6^{\circ}$ |

| $3^{\text {rd }}$ August | $4.5 \pm 0.3^{\circ}$ |
| :---: | :---: |
| $4^{\text {th }}$ August | $4.7 \pm 0.4^{\circ}$ |
| $5^{\text {th }}$ August | $4.1 \pm 0.4^{\circ}$ |
| $6^{\text {th }}$ August | $4.3 \pm 0.4^{\circ}$ |
| $10^{\text {th }}-11^{\text {th }}$ Augus $t$ | $3.5 \pm 0.2^{\circ}$ |
| $11^{\text {th }}$ August | $3.3 \pm 0.3^{\circ}$ |
| $11^{\text {th }}$ August | $3.4 \pm 0.2^{\circ}$ |

## MC - beam tilt dependence

- Keep silicon and cal angles w.r.t. beam equal and vary them together
- Plot $x-\eta$ slope as function of beam tilt

Slope vs. beam tilt (dilu $=0.04$ )

- Seems simulating a beam tilt of a few degrees can have relatively large effect on $x-\eta$ slope (compared to data value of -1.3)

## MC - DILU dependence

- Plot $x-\eta$ slope as a function of DILU (fraction of light penetrating into opposite cal plate - up/down)
- Find that, given the size of errors, DILU has no significant effect on the $x-\eta$ slope (compared to data value of -1.3 )
- Vary DILU until find value whose $\eta$ distribution best matches the data
- DILU = 0.05
- (N.B. should really do this whilst reoptimising other parameters)

Silicon Alignment Study

## MC - polarisation dependence

- Seems Py has no effect on $x-\eta$ slope (as expected) so no need to simulate the exact value for each data sample for the rotation study

Energy (up + down)

Energy / GeV
Silicon Alignment Study

## Asymmetry (u/d and I/r)

Left-right asymmetry

Catherine Fry
Silicon A Alignment Study

## Number of silicon clusters

Number of clusters in $\mathbf{x}$

## Silicon cluster position

Single cluster distribution in x

Single cluster distribution in y

## Silicon cluster charge

Single cluster charge in $x$

Single cluster charge in $y$

## The measurement

- In MC fix silicon angle w.r.t. beam to that measured by ellipse fit for each data sample
- Vary cal angle w.r.t. beam and simulate 200k events at each angle
- Measure $x-\eta$ slope from MC for each cal angle
- Plot $x-\eta$ against cal angle and fit a straight line
- From fit, calculate which cal angle matches the $x-\eta$ slope from the data

## Si-Cal angle

| Date | Beam tilt $/^{\circ}$ | Cal angle ${ }^{\circ}$ | Angle between silicon and cal $/{ }^{\circ}$ |
| :---: | :---: | :---: | :---: |
| $1{ }^{\text {st }}$ Mar | $6.8 \pm 0.4$ | $1.7 \pm 0.2$ | $4.4 \pm 0.5$ |
| $7^{\text {th }}$ Mar | $4.6 \pm 0.2$ | $1.9 \pm 0.1$ | $2.7 \pm 0.3$ |
| $24^{\text {th }}$ May | $3.0 \pm 0.2$ | $1.4 \pm 0.1$ | $1.8 \pm 0.2$ |
| $8^{\text {th }}$ July | $3.4 \pm 0.3$ | $1.2 \pm 0.2$ | $2.2 \pm 0.3$ |
| $9^{\text {th }}$ July | $3.4 \pm 0.5$ | $1.9 \pm 0.2$ | $1.5 \pm 0.6$ |
| $12^{\text {th }}$ July | $3.4 \pm 0.3$ | $1.5 \pm 0.2$ | $1.9 \pm 0.4 \quad \square$ |
| $13^{\text {th }}$ July | $4.7 \pm 0.4$ | $1.9 \pm 0.2$ | $2.8 \pm 0.4$ aver |
| $15^{\text {th }}$ July | $3.5 \pm 0.6$ | $1.4 \pm 0.2$ | $2.2 \pm 0.6$ |
| $3^{\text {rd }}$ August | $4.5 \pm 0.3$ | $2.1 \pm 0.2$ | $2.4 \pm 0.3 \quad 2.2 \pm$ |
| $4^{\text {th }}$ August | $4.7 \pm 0.4$ | $1.9 \pm 0.2$ | $2.8 \pm 0.4$ |
| $5^{\text {th }}$ August | $4.1 \pm 0.4$ | $1.9 \pm 0.2$ | $2.1 \pm 0.4$ |
| $6^{\text {th }}$ August | $4.3 \pm 0.4$ | $1.7 \pm 0.2$ | $2.6 \pm 0.4$ |
| $10^{\text {th }}$ - $11^{\text {th }}$ August | $3.5 \pm 0.2$ | $1.3 \pm 0.2$ | $2.2 \pm 0.3$ |
| $11^{\text {th }}$ August | $3.3 \pm 0.3$ | $1.5 \pm 0.2$ | $1.8 \pm 0.3$ |
| $11^{\text {th }}$ Aug | $3.1 \pm 0.2$ | $1.5 \pm 0.1$ | $1.8 \pm 0.3$ |

## Conclusions

- Made 15 measurements of misalignment angle between silicon and calorimeter
- Average angle $=2.2 \pm 0.4^{\circ}$
- Not yet had time to compare ellipse-fit method of measuring beam tilt with the laser scan method
