Seen signals, unseen signals, seen un-signals (?)

- Discovery of a light Higgs boson leaves still open questions:
 1. Nature of Electroweak Symmetry Breaking
 2. Higgs boson potential, all the way like the Standard Model!?
 3. Does it fulfill the US-fermion/Europe-boson rule?
 4. Is the 125 GeV state the only resonance in the system of EW vector bosons?
 5. How do EW vector bosons scatter? (true heart of weak interactions)
 6. Is there something related to the Little Hierarchy problem (strong or weak)

Exploration of E-frontier → look for heavy objects, including high-mass $V_L V_L$ scattering:
□ requires as much integrated luminosity as possible (cross-section goes like 1/s)

Anatomy of Vector Boson Scattering (VBS)

$$pp \rightarrow WWjj \rightarrow \ell\nu\nu jj$$

Backgrounds [+ $V_T V_T$ bkgd.]:

- $tt \rightarrow WbWb$
- $W + jets$
- single top, misreconstructed jet
- $WWjj$ QCD production
- $ll + X + Emiss$ (“prompt”)

Fiducial phase space volume:

- $lljj$ tag
- $m_{jj} > 500$ GeV (“jet recoil”)
- $y_{j,1} \cdot y_{j,2} < 0$ (“collinear beams”)
- $|\Delta y_{jj}| > 2.4$ (“rapidity distance”)
- Cuts on E_j , p_T^j
- No mini jet vetoes

EFTs: Higher-dimensional operators

- ◆ Must include all dim 6 operators from SM fields Buchmüller/Wyler, 1986
- ◆ Redundancy of operators \implies minimal set of operators (in principle)
 1. Equations of motion: $D_\mu \mathbf{W}^{\mu\nu} = \Phi^\dagger (D^\nu \Phi) - (D^\nu \Phi)^\dagger \Phi + \dots$
 2. Gauge symmetry: $[D_\mu, D_\nu] \Phi \propto \mathbf{W}_{\mu\nu} \Phi$
 3. Integration by parts: $(\Phi^\dagger \Phi) \square (\Phi^\dagger \Phi) \longrightarrow \partial_\mu (\Phi^\dagger \Phi) \partial^\mu (\Phi^\dagger \Phi)$
- ◆ Further reduction by use of discrete / horizontal symmetries
 1. B and L conservation (excludes 5 operators per generation)
 2. Flavor symmetries (assumption: Minimal Flavor Violation)
 3. CP symmetry
- ◆ Assuming B and L conservation: number of operators (without ν_R)

Scenarios for New Physics in VBS

1. **SM or weakly coupled physics (e.g. 2HDM):** amplitude remains close to origin
2. **Rising amplitude (at least one dim-8 operator):** rise beyond unitarity circle [unphys.], strongly interacting regime
3. **Inelastic channel opens (form-factor description):** new channels open out, multi-boson final states
4. **Saturation of amplitude:** maximal amplitude, strongly interacting continuum, K-/T-matrix unitarization
5. **New resonance:** amplitude turns over

Procedures to treat unitarity violations

Cut-off (a.k.a. “Event clipping”) $\theta(\Lambda_C^2 - s)$

unitarity bound (0th partial wave) at Λ_C
no continuous transition beyond

Complete LHC process at 14 TeV

Triple [multiple] Vector Boson Production ?

Relate

to

?

- ▶ Yes, same Feynman rule as in VBS, but ...
- ▶ one external $W/Z/\gamma$ always far off-shell
- ▶ Unitarization formalism not available (would need $2 \rightarrow 3$ unitarizations)
- ▶ Different Wilson coefficients dominate (particularly for resonances)
- ▶ Important physics (partially) independent from VBS

Conclusions / Summary

- ◆ Vector boson scattering one of flagship measurements of Runs II/III
- ◆ EFT provides *a* (!) [not *the*] consistent framework for SM deviations
- ◆ Very well-defined (and limited) range of applicability
- ◆ Accounts for access to New Physics in VBS and Di-/Triboson channels
- ◆ Unitarization for theoretically sane description (allows to calculate 'best limit')
- ◆ *T*-matrix unitarization universal scheme for EFT and resonances
- ◆ Simplified models: generic electroweak resonances
- ◆ Limits from LHC still incredibly limited: $M \sim 200\text{-}300$ GeV
- ◆ Make sure that actual limits are meaningful and comparable

Parameterizing SM deviations

★ Specific models (SUSY, Compositeness, Little Higgses, 2HDM, Modified Higgses, Xdim,

- Could give strong signals in VBS (presumably Little Higgses, Compositeness, Xdim)
- Could give faint signals in VBS (presumably SUSY, 2HDM [Higgs data!],)
- Up to parametric uncertainties precise predictions from the models (new independent couplings)
- Mostly even beyond tree level predictable
- Analysis has to be repeated for each and every model, introduces new parameters

★ Anomalous Couplings

- Usually first “model-independent” proposal
- At the moment applied by HXSWG (but under debate)
- Only modifications of SM couplings or introduction of new (Lorentz) structures ?
- Allows fits of coupling strengths
- Possible deviations difficult to interpret in terms of quantum field theory, unitarity!!

General Procedure using EFTs

- Use all experimental observables \implies global fit to all Wilson coefficients
- Would-be optimal approach
- Too many independent variables \implies needs staged fitting
- **Need for simplifying assumptions**
- **Try to find minimal “physically well motivated” operator basis**
- Experimental bias: consider only LHC-accessible operators
- Cross check from low-energy physics (flavor / EDMs / EWPO etc. / Higgs!)
- Explore full structure of EW Higgs doublet:

How to get EFTs from New Physics

- ✦ Consider effects from heavy states by using (known) low-energy d.o.f.s

In addition to being a great convenience, effective field theory allows us to ask all the really scientific questions that we want to ask without committing ourselves to a picture of what happens at arbitrarily high energy.

$$\mathcal{O}_{Vq} = \frac{1}{\Lambda^2} \bar{q} \Phi (\not{D} \Phi) q$$

Couplings of new states to the longitudinal / transversal diboson system

	$J = 0$	$J = 1$	$J = 2$
$I = 0$	σ^0 (Higgs singlet?)	ω^0 (γ'/Z' ?)	f^0 (Graviton ?)
$I = 1$	π^\pm, π^0 (2HDM ?)	ρ^\pm, ρ^0 (W'/Z' ?)	a^\pm, a^0
$I = 2$	$\phi^{\pm\pm}, \phi^\pm, \phi^0$ (Higgs triplet ?)	—	$t^{\pm\pm}, t^\pm, t^0$

Different power counting for weakly and strongly interacting theories

$$\frac{c_i}{\Lambda} \sim \frac{g}{4\pi\Lambda} \quad \text{vs.} \quad \frac{c_i}{\Lambda} \sim \frac{g}{\Lambda}$$
