

# **Materials and gases: Lessons for detectors and gas systems**

**Mar Capeans  
CERN**

---

Invited review talk at the International Workshop  
on Aging Phenomena in Gaseous Detectors

# Outline

---

- Ageing
- Outgassing studies
- Detector Assembly Materials
- Detector Assembly Procedures
- Components for Gas Systems
- Influence of Some Gases on Ageing

# The Very Basic Knowledge

- Gaseous detectors operated in a **high radiation** environment can have serious operational problems due to **ageing**.
- Commonly ageing manifests as:
  - Loss of gas gain
  - Worsening of energy resolution
  - Excessive currents
  - Self-sustained discharges
  - Sparking

All these are usually related to the **presence of deposits** coating the electrodes (anode and/or cathode).

# Basic Knowledge

---

- The ageing process is due to very **complex phenomena** that take place during the gas avalanche (~ plasma chemistry).
- These phenomena lead to the creation of a wide variety of species that may accumulate as **deposits**, conductive or insulating, on the electrode surfaces.

## Polymerization

### Polymers

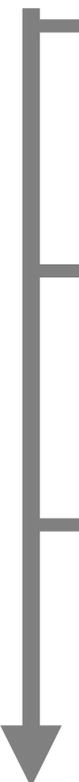

- Solid, highly branched and cross linked
- Excellent adhesion to surfaces
- Resistant to most chemicals
- Insoluble in most solvents

# Basic Knowledge

---

- **Measured ageing, quantitative and qualitatively, depends on many factors:**
  - **Gas gain**
  - **Gas flow & Pressure**
  - **Charge density**
  - **Geometry and configuration of electric field**
  - **Active gas**
    - ↳ **Nature of gas**
    - ↳ **Traces of contaminants**
- **Experimental observations are difficult to compare and/or extrapolate between one another.**

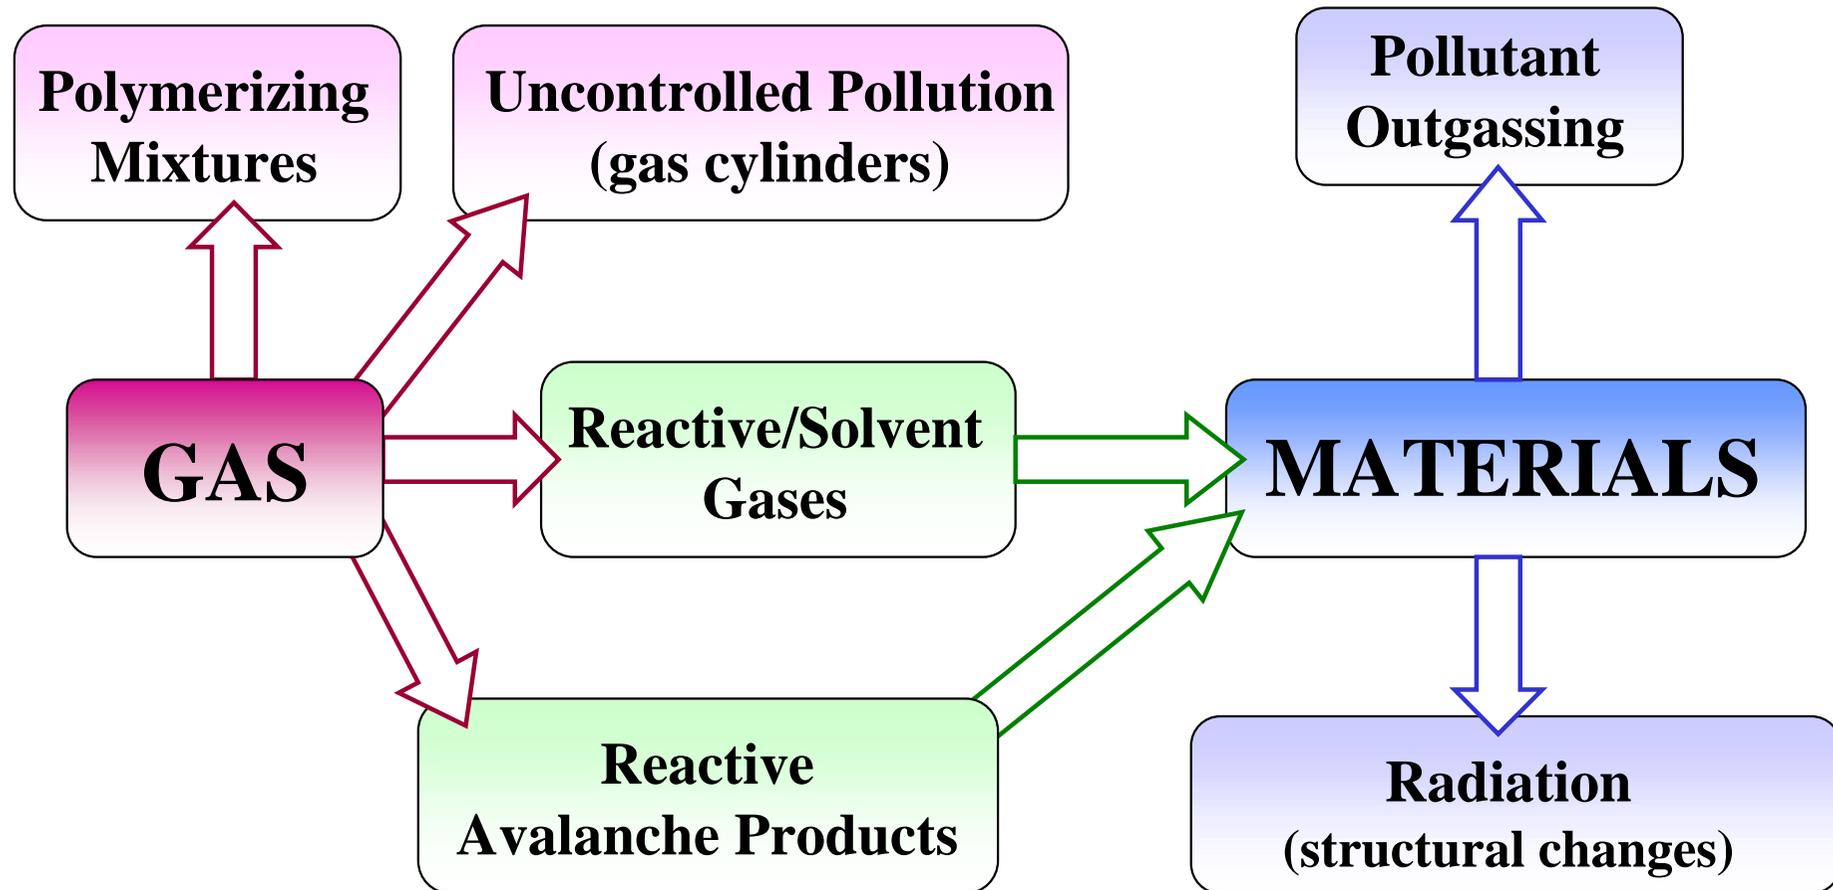

## Recent experience

1986	SSC @ US	SDC Straw tubes, Pad chambers,...
	LEP @ CERN	DELPHI,...
1990	Basic R&D	RD-10, RD-28, RD-6,...
	MSGC community	RD-28, Hera-B, CMS, ATLAS,...
1994	Detector R&D for LHC	ATLAS-TRT, ATLAS-MDT, CMS CSC,...
	Hera-B construction	OTR, ITR, Muons

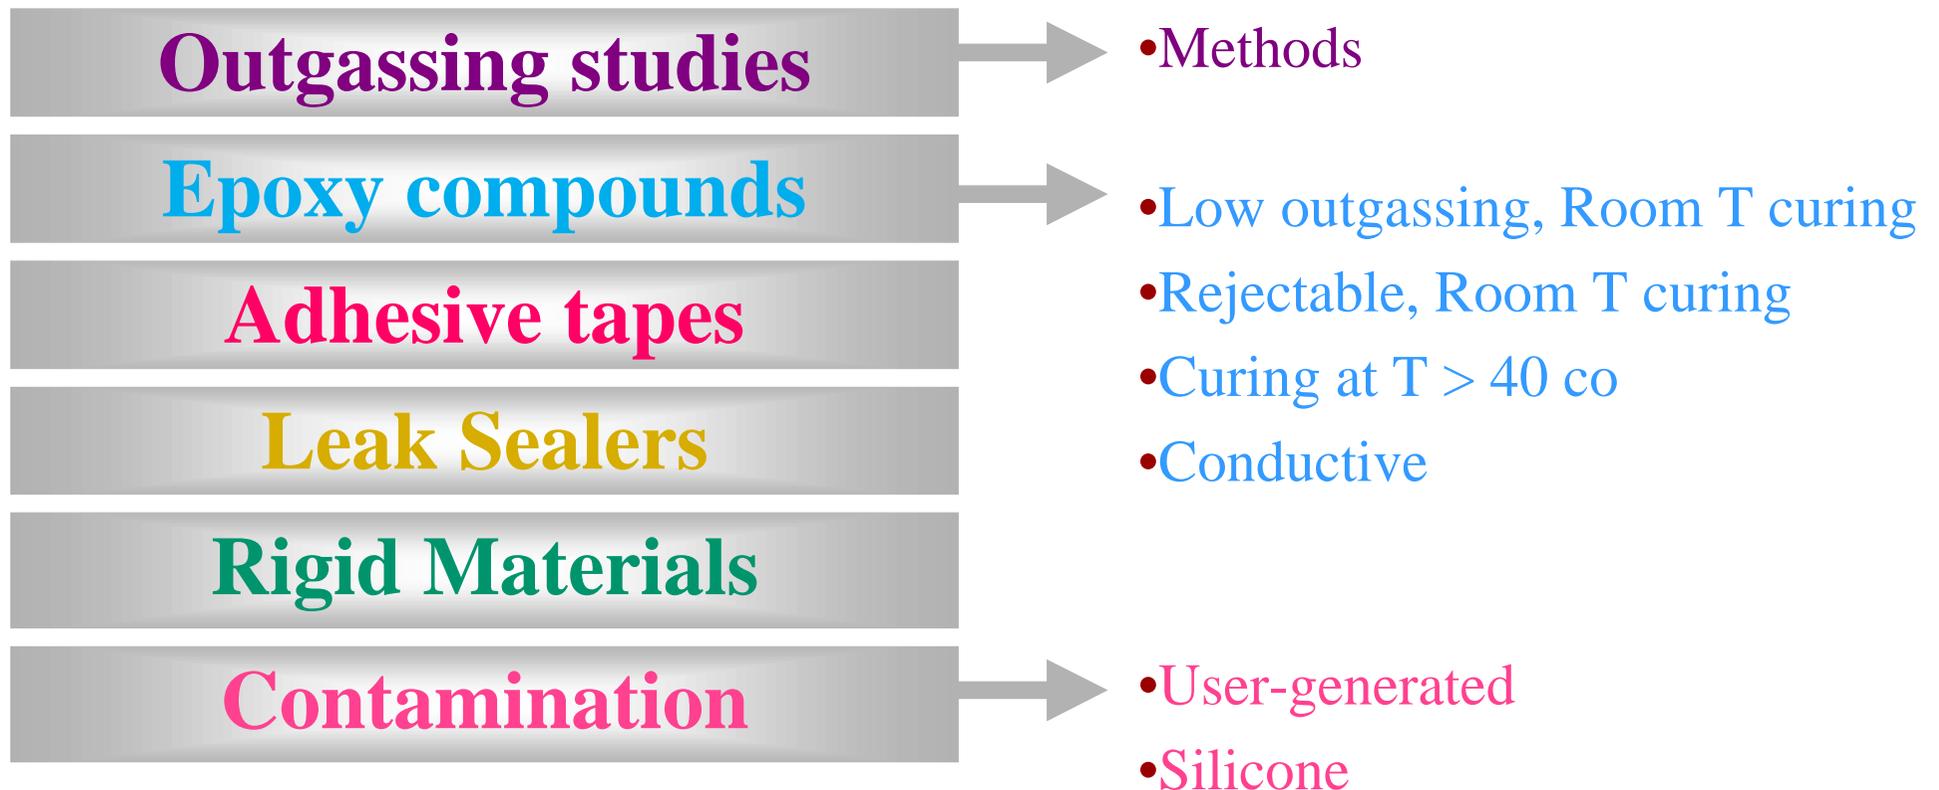

**Still comparison and/or extrapolation is difficult but all this experience provides a solid basis for discussion**

# Contributions to the Ageing Process

# Outgassing Tests of Some Materials

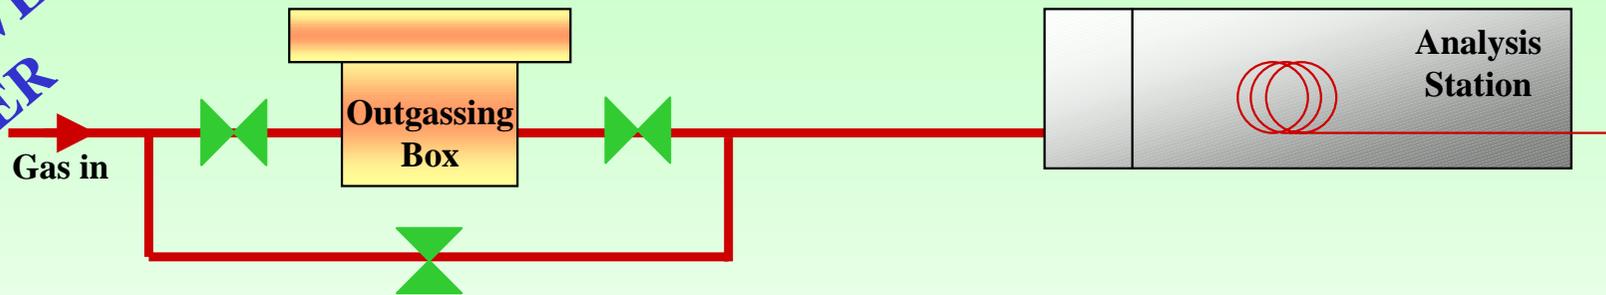

---

# The Minimal Set-Up

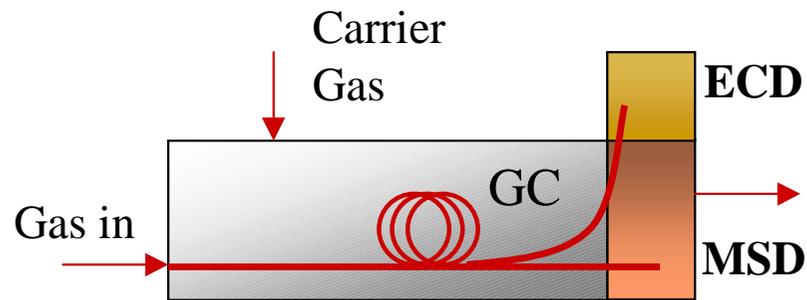

## Gas analysis of a sample

PRE-SELECTIVE  
CHARACTER

- Impurity detection has the intrinsic limitations of the analysis station, that may not be sensitive to all species because of:
  - low pollutant concentration
  - specific sensitivity
- Sometimes heating of the sample is needed to detect outgassing (scaling factor unknown).
- Even if outgassing is detected, it might not be harmful for the gaseous detector.

# Gas Chromatography Basics

**GC:** oven with a capillary column.

Function: it **separates** gas substances depending on their interaction properties with the column.

Signal: a signal appears for each separated compound at some retention time, defined by the column and temperature profile.

**MSD:** 70 eV  $e^-$  source to ionize and fragment molecules + quadrupole mass filter to sort resulting ions according to their M/Z ratio.

Function: it **identifies** each molecular compound.

Signal: ion abundance as function of retention time in the column or M/Z ratio.

Sensitivity: ~ ppm

**ECD:**  $\beta e^-$  bombard a carrier gas to form a plasma. Thermal  $e^-$  are collected applying an E-field. The decrease of the detector current due to removal of thermal  $e^-$  by recombination in presence of electro-capturing compounds gives a signal.

Function: **detection of electronegative** substances

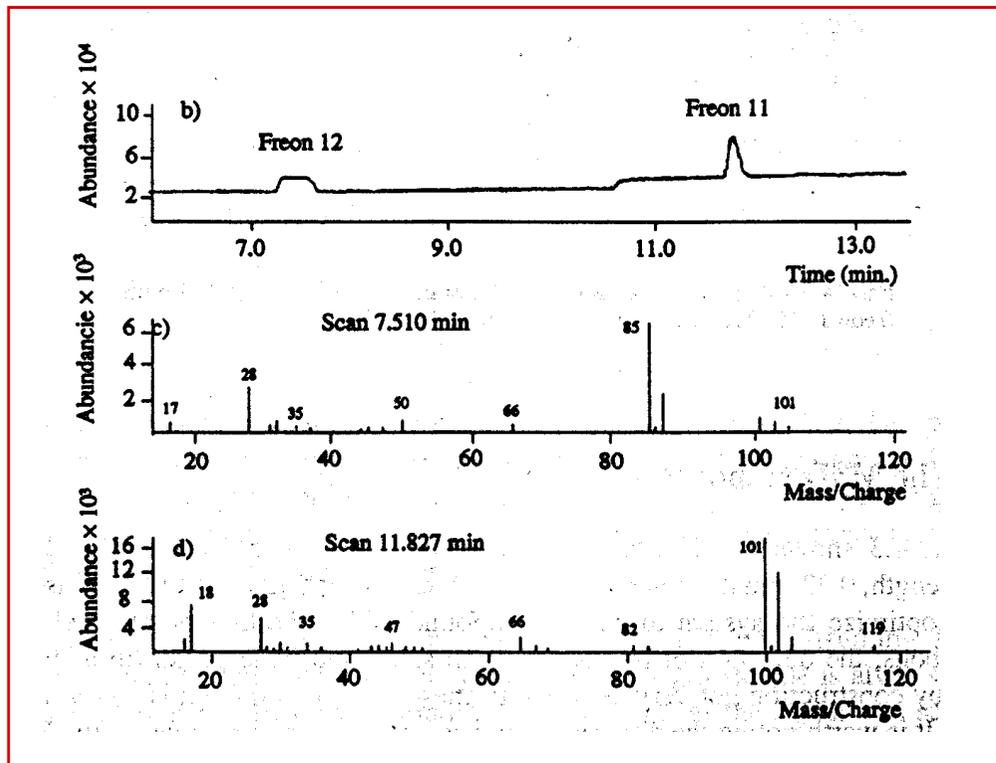

Signal: signal amplitude vs. time.

Sensitivity: ~ ppb

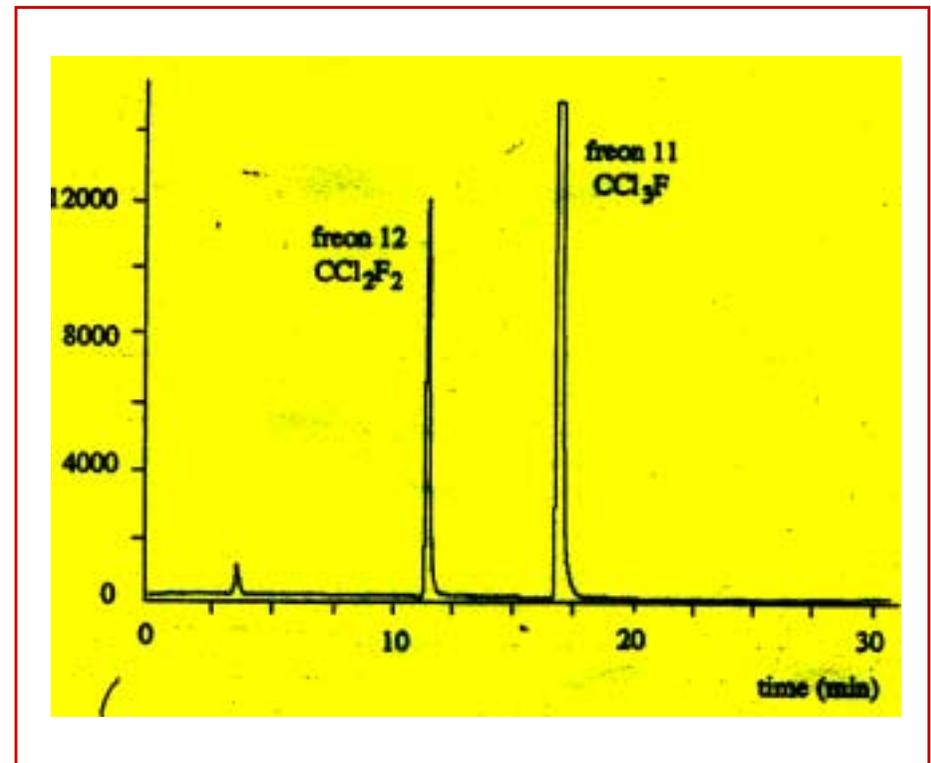

# Gas Chromatography Basics

Selection of column, temperature profile and carrier gas nature and flow defines the sensitivity of the station.

**MSD signal 10 ppm F12+F11**

**ECD signal 10 ppm F12+F11**

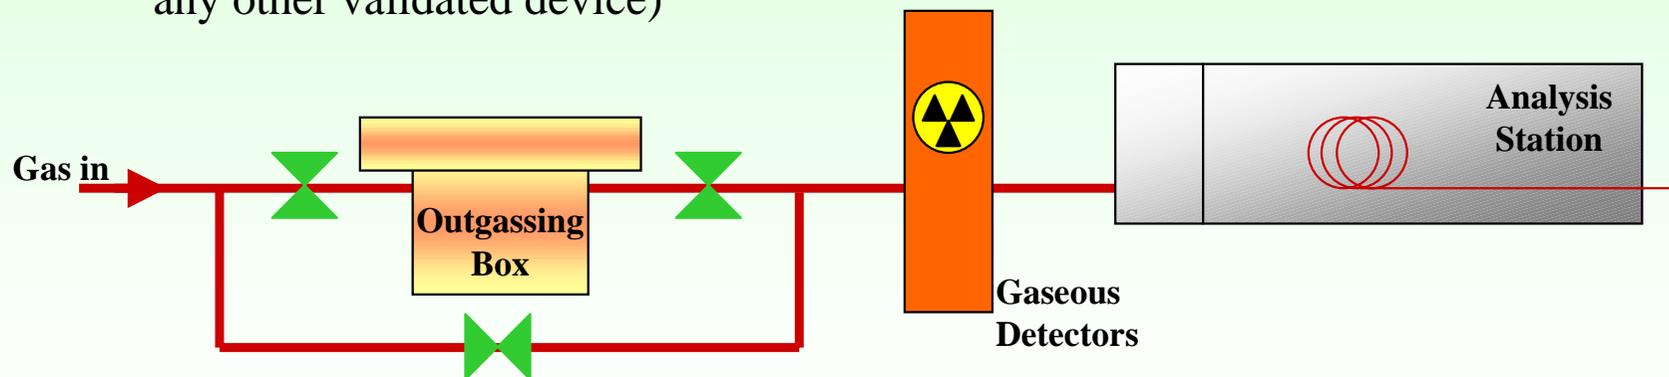

# Gas Analysis + Detector irradiation

To get information about the effect of pollutants:

## Gas Analysis + Ageing Test

Clean Gas detector  
(full metal SWPC or  
any other validated device)

Small prototype of final detector

**Limitations:**

- Irradiation conditions (high dose rates)
- Time scale (~months)

## TML & CVCM Method

- **Developed at NASA to search low outgassing materials for spacecraft use.**

<http://epims.gsfc.nasa.gov/og/index.cgi>

- **Test of conditioned micro-quantities** in vacuum at stated temperatures and specific times.
- **Technique of condensing the volatile products** to determine the amount of volatile condensable materials.
- **Output: Low Outgassing Material TLM < 1% & CVCM < 0.1%**

PRE-SELECTIVE  
CHARACTER

**% TML = Total Mass Loss**

It is determined from the weights before and after the temperature exposure.

**% CVCM = Collected Volatile Condensable Materials**

It is the difference between the weight of a clean collector and of the collector having condensed materials.

# Epoxy Compounds

## Parameters to take into account during selection:

- Shear strength
  - Elongation at break
  - Viscosity
  - Electrical properties
  - Capillary effect
  - Radiation resistance
  - **Outgassing** →
- **Material itself**
  - **User-generated (hard to trace):**
    - **Pollution**
    - **Incorrect ratio of hardener to resin**
    - **Insufficient mixing**
    - **Insufficient curing time**

## Low Outgassing Epoxy Compounds Room-T Curing

**Consult NASA database** to select materials, before doing the time-consuming tests  
 NASA Database: More than 1600 entries for adhesives, 500 entries for rubbers and elastomers, 800 entries for potting compounds, etc...

# Silicone Contamination

- Silicone has been systematically found **coating** aged chambers.
- Silicone has a high **natural affinity** for most materials.
- Silicone has the tendency to **migrate**.
- Silicone is relatively **inert chemically** and unaffected by most solvents, therefore among the most difficult surface contaminants to remove.
- Silicone is **etched** away by F-species.

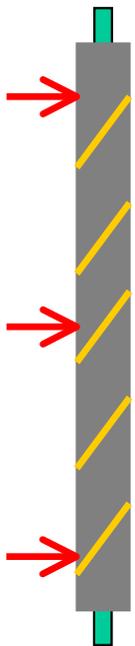

## Possible Sources:

- Silicone rubber **sealants**
- Silicone **potting** and encapsulation compounds
- Silicone **adhesives**
- Silicone Vacuum **Grease** (O-rings, mould-release agents)
- Silicone **oil** (bubblers, diffusion pumps)
- Polluted gas **cylinders**
- **Detergent** residues (sodium metasilicate)
- **Glass** and related products (glass fibres used for reinforcing resins)

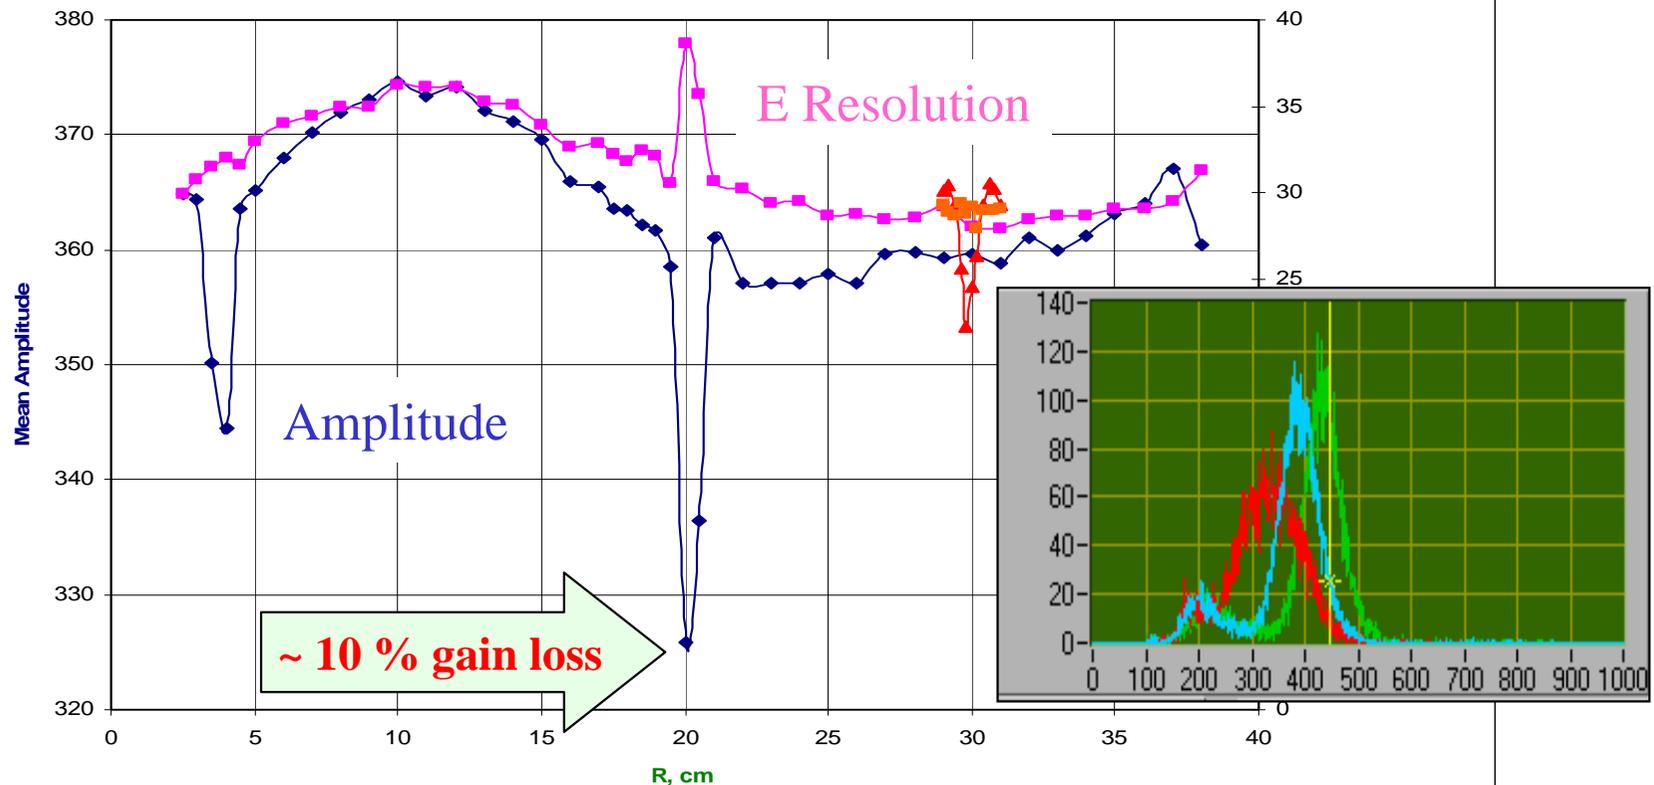

# Accidental Silicone Contamination

ATLAS/TRT  
S. Mouraviev  
CERN

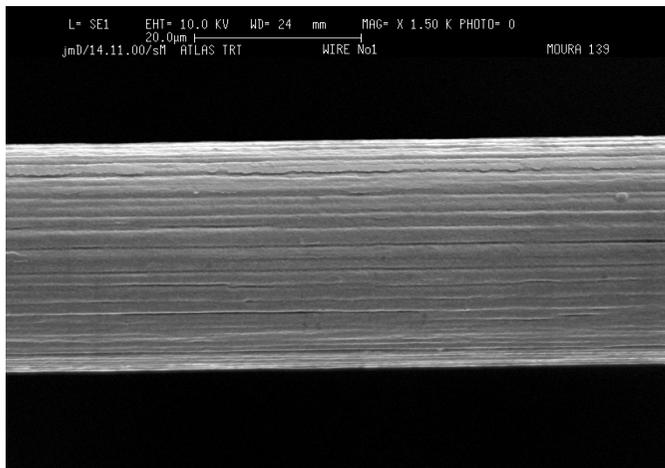

Weak  $^{55}\text{Fe}$  ~ 700 Hz

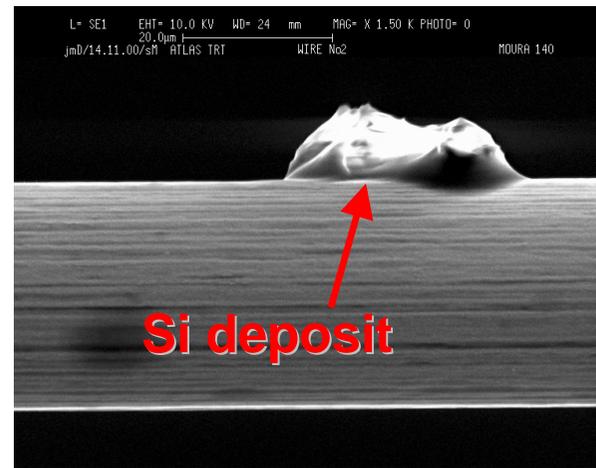

Wheel 2, straw p96g1c06 after 14 hours irradiation

# Silicone Contamination

Clean wire

Irradiated spot

Region between  
two irradiated spots

## Silicone Source:

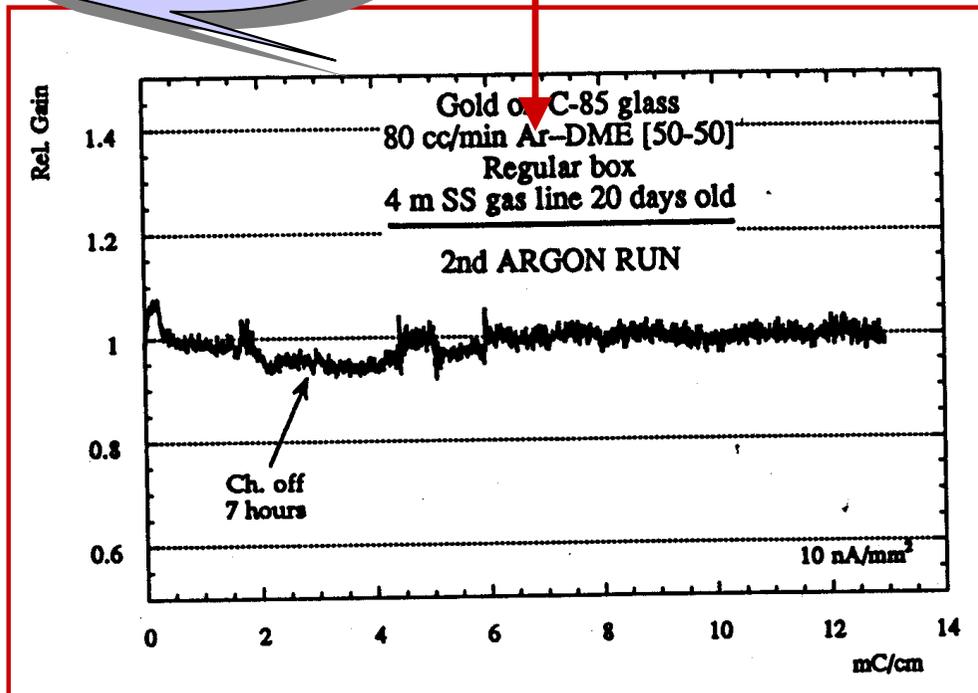

Silicone-based lubricant used accidentally during straw tube manufacturing by the manufacturer.

Mass production straws are free of pollution (no lubricant at all).

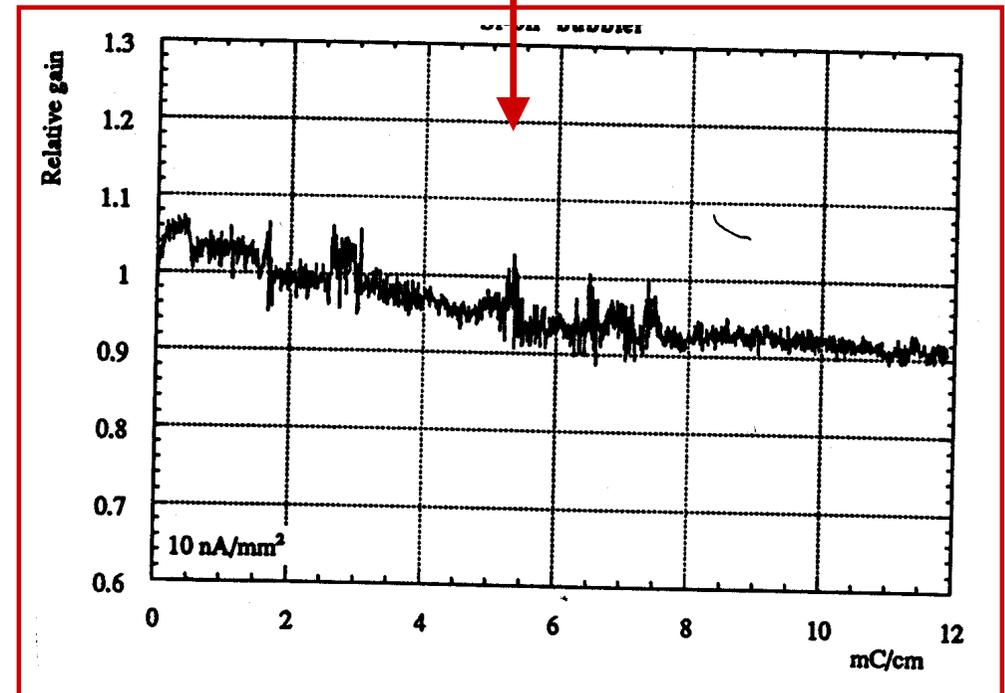

# Silicone Contamination: Si-bubbler

MSGC in  
clean gas system

GDD Group  
CERN

Add **Silicon-oil bubbler**  
to chamber exhaust

# Detector Assembly Procedures

---

**Contaminants during the assembly process such as dust particles or an invisible film of organic material can make the best-designed detector fail.**

**Assembly area**

**Equipment**

**Personnel**

**Assembly Procedures**

## Assembly Area

The assembly area must be **isolated** from other manufacturing areas, and usually following clean room standards.

Hera-B/OTR  
Desy

4 assembly sites located worldwide:

Nb. of particles  $> 0.3 \mu\text{m}$  in a 0.1 cubic foot of air

**WHICH  
LEVEL?**

Detector: drift tubes of small diameter

Gas: Ar-CO<sub>2</sub>-CF<sub>4</sub>

Rate  $\sim 3 \times 10^5$  Hz/cm<sup>2</sup>, dose  $\sim 100$  krad/y

Office: 440000

Std hall: 770000

Area 1: 1 - 20

Area 2: 1 - 15

Area 3: 760000

Area 4: 520000

**All modules behaved equally well during HV testing and running in the Hera-B environment.**

# Equipment

---

Some equipment should be avoided **or protected**

**Examples of contamination are:**

- Tools with **lubricated** shafts, cranes...
- **Soldering** or brazing equipment that require heating of volatile fluxes
- Motors and vacuum pumps with **outgassing oils**
- **Some electronic equipment** contain capacitors, resistors, etc coated with organic or insulating materials that outgas

# Personnel

---

Usual source of contamination.

Need careful and exhaustive **training**.

Examples of contamination are:

- **Street clothing** (source of lint)
- **Hair, make-up, fingernails** (source of oil and particulates)
- **Many hand creams and cosmetics** (contain silicones)
- **Saliva**
- **Fingerprints** (source of fat, possible cause of corrosion in some metals, etc)

# Assembly process

---

It has to:

- Be well **specified and stable**
- Be **rechecked** periodically
- Include specification for the **storage** of parts
- Include **procedures** about:
  - cleanliness of assembly components
  - verification of cleanliness
- Include **tracing capability**
  - operator ID, assembly step, material batch, environmental parameters, etc

# About Gas System Components

---

**Compatibility Aspects**

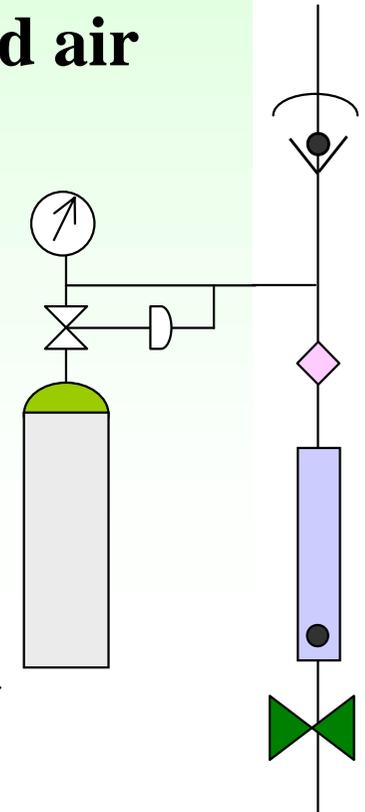

**Clean Components**

**The Golden Rule**

- 
- Validation
  - P-regulators
  - Flowmeters
  - Valves
  - Connectors
  - Piping
  - Elastomers

# Gas systems used for:

- **Assembly procedures**
  - **Wiring, etc**
  - **Cleaning of components (N<sub>2</sub> or compressed air guns)**
  - **Cooling of assembly set-ups**
  - **Polymerization of glues**
  - **Others**
- **Acceptance tests at the laboratory**
- **Final gas systems in experimental area**

# Compatibility

---

- **Materials VS Ageing**
- **Chemical compatibility with operating gas**
- **Purity and cleaning of components**
- **For final gas systems:**
  - **Radiation**

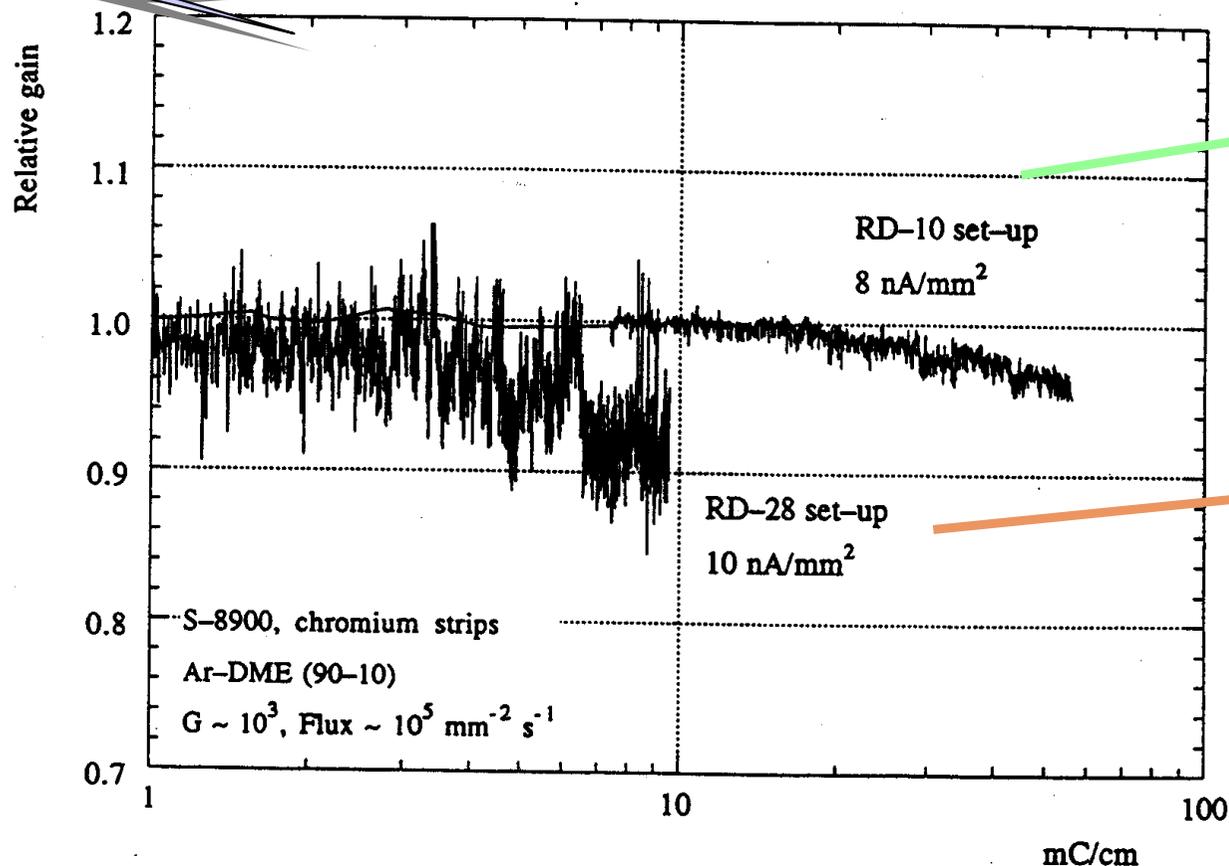

Test of electronic components
  - **Magnetic field**

Avoid electro-magnetic valves, electro motors, relays.  
Check control valves, pressure sensors, power supplies, etc.

# Valves

## Ageing test of the same MSGC (Ar-DME 90-10) in 2 gas systems

GDD Group  
CERN

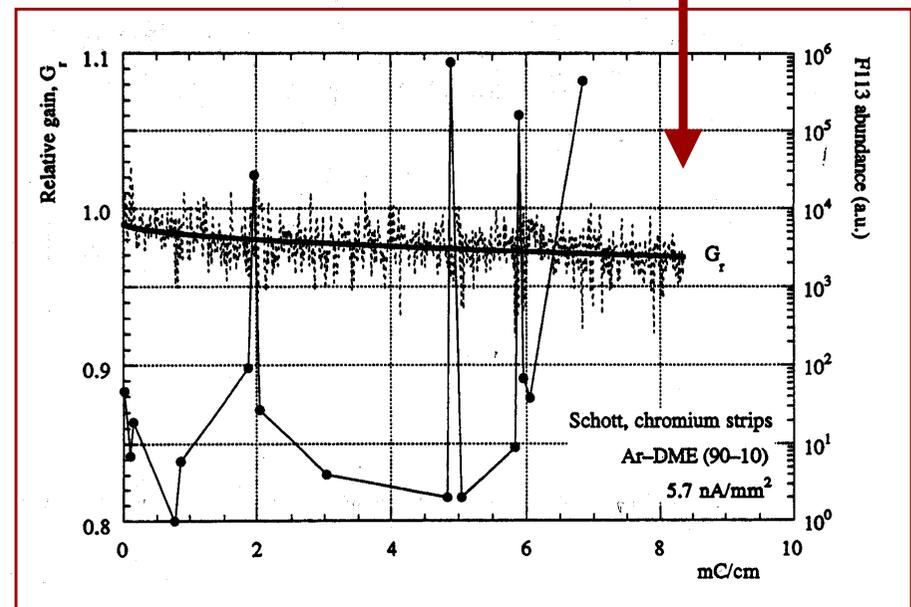

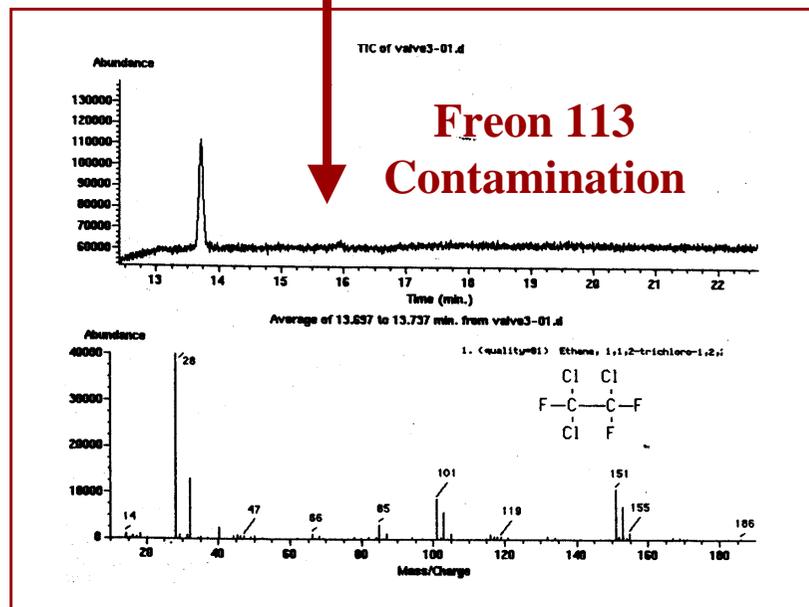

1  
ultra-clean  
full metal  
Kemraz

2  
standard cleanliness  
Viton joints  
std metal valves  
Cu-exhaust  
Torr-Seal sealing

# Valves

## Systematic study (GC) to search the origin of pollution

- Isolate components of the std. gas system
- Manual SS ball-valve (PFTE joint) found suspicious
- Take valve to ultra-clean setup
- Ageing Test + accelerated rate of outgassing

## Search for Clean Components

---

### The ATLAS-TRT approach:

ATLAS/TRT  
CERN

- **Problem:**

**straw tubes are very sensitive to silicone pollution**

- **Approach: use only clean components**

Market-survey to look for clean gas components equivalent to ultra-high purity standards in terms of very low outgassing rates and absence of lubricants (especially silicone-based).

The requirements have to be discussed with the companies.

# Search for Clean Components

---

## Components

- Cylinder P-regulators
- Filters
- Flowmeters
- Valves
- Exhaust
- Piping
- Connectors

## Validation of Components

### Straw tube AGEING Tests

- Nominal gas:  
Xe-CF<sub>4</sub>-CO<sub>2</sub> 70-20-10
- Time Length: 1000 hours
- Dose: 1 mm collimated source <sup>55</sup>Fe, 5 KHz

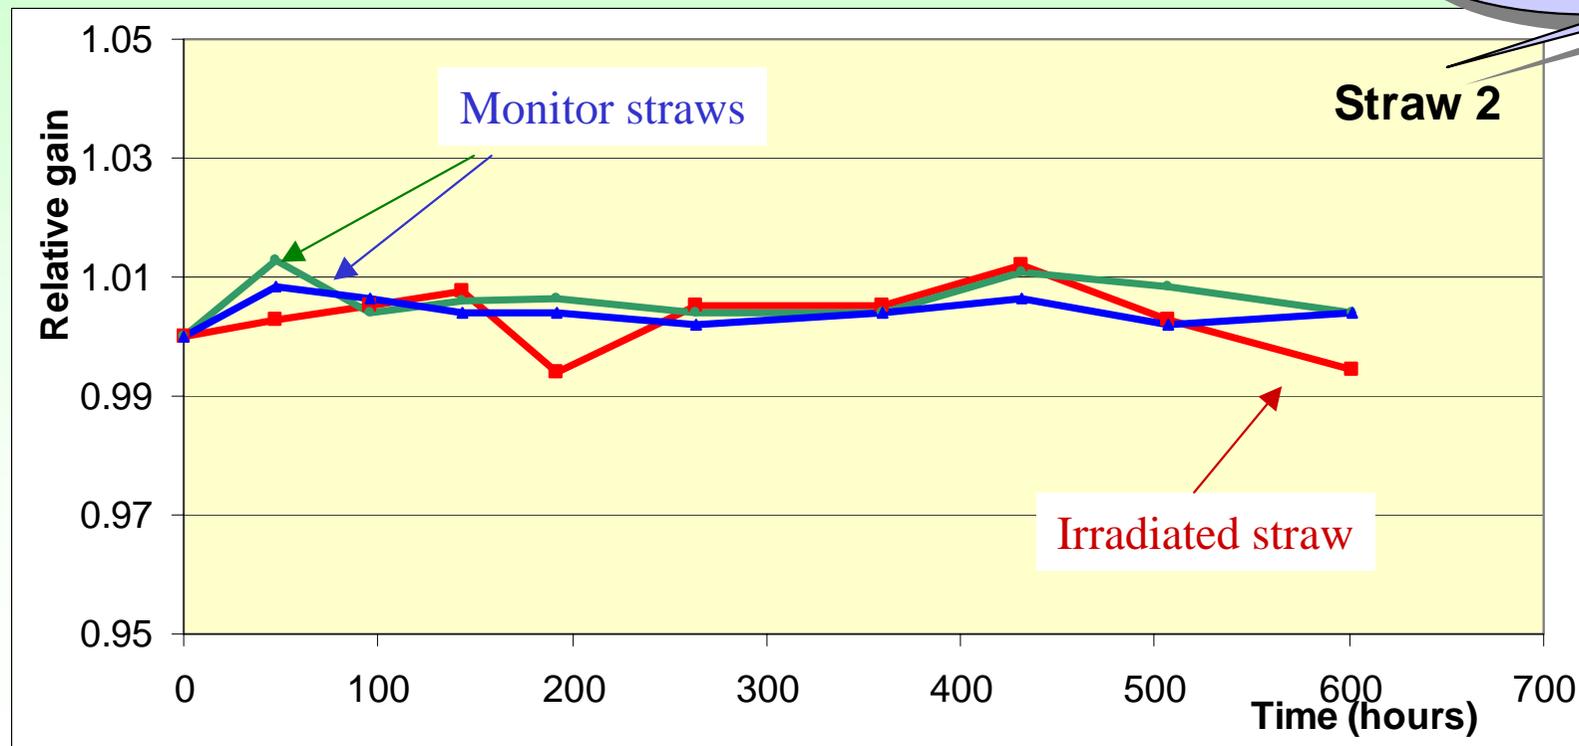

## Pressure Regulators

Studied in detail 15 different models from ~10 companies.

Knowledge	Price <sub>CHF</sub>
<p><b><u>Ultra-high purity applications</u></b> (semiconductor industry): Lubricant-free certified &amp; excellent surface quality.</p> <p><b>Reducing our requirements (in terms of surface quality):</b> - Brass option at <i>SCOTT Specialty Gases (model C21-8)</i> - <i>Parker Veriflo line (model IR4002)</i></p>	<p>&gt; 2000</p> <p>~ 600</p>
<p><b><u>High purity applications:</u></b> Lubricant-free certified, but experience tell us that it might NOT be true.</p> <p><b>Some companies produce affordable, clean products:</b> <i>TESCOM (serie04)</i></p>	<p>&gt;1000</p> <p>~ 600</p>
<p><b><u>Standard applications:</u></b> They might be certified lubricant-free by suppliers... For safety, <b>they always need additional cleaning</b></p>	<p>~ 300 - 600</p>

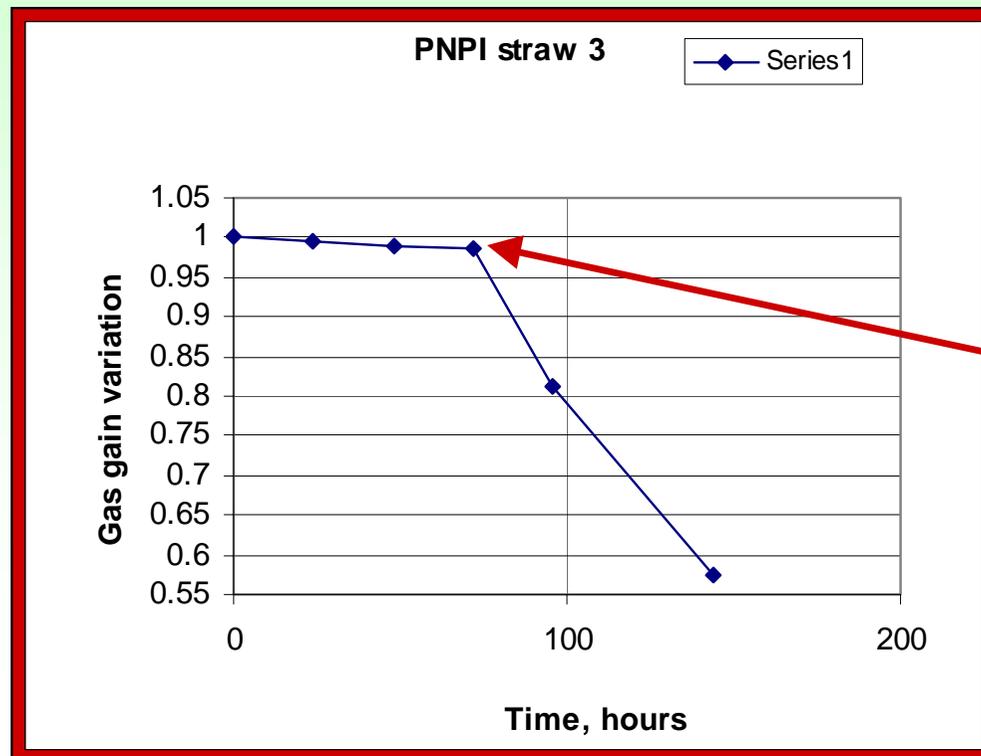

# Pressure Regulators

## Validation of P-regulator dual stage SCOTT C21-8

# Flowmeters

- When possible, use electronic mass flowmeters with the adequate O-rings.
- Mechanical flowmeters: Cheap BUT Assembled with lubricants

ATLAS/TRT  
CERN

VOEGTLIN Flowmeter  
Type V100 (CERN std.)  
Inserted in gas stream

# Flowmeters

## Cleaning flowmeters

Ultrasonic cleaning of dismantled pieces.

ATLAS/TRT  
COMPASS  
CERN

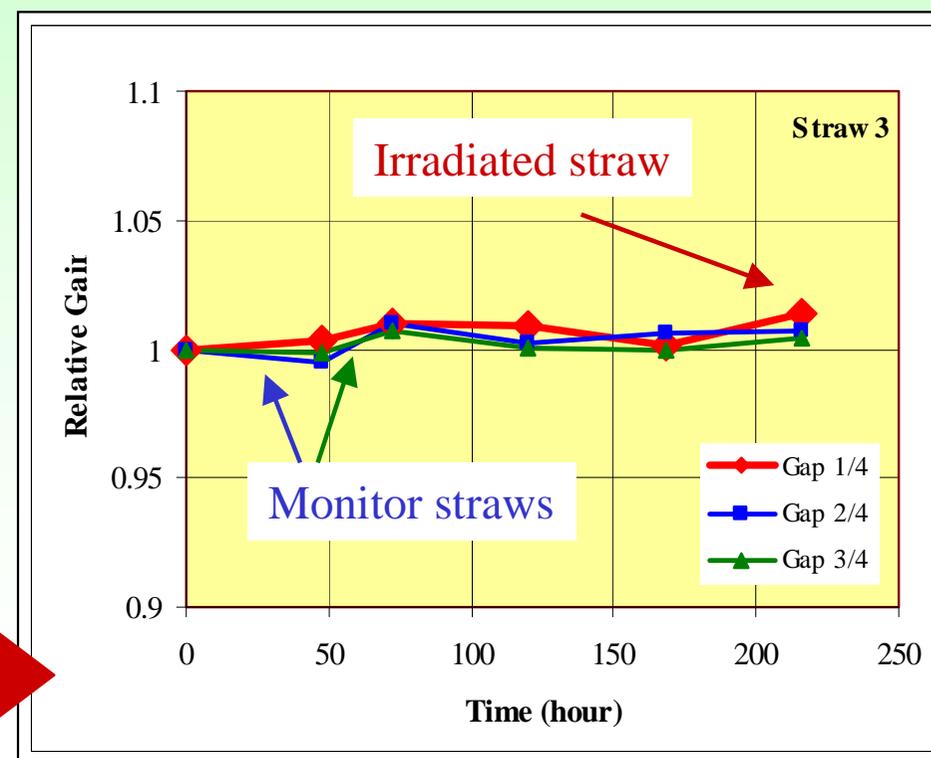

By M.Bosteels (CERN):

15' Ultrasonic bath Isopropyl alcohol  
15' Ultrasonic bath Isopropyl alcohol  
15' Ultrasonic bath ultra pure water  
20 h at 70-80 °C

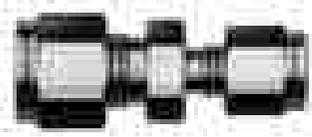

REMOVES GREASE!

**CLEANED VOEGTLIN Flowm.**

Type V100 (CERN std.)  
Inserted in gas stream

## Connectors

Unions, elbows, nuts, etc...

ATLAS/TRT  
CERN

**Company**

**Note**

SWAGELOK

**Certified lubricant-free.**

If additional SC-11 cleaning, price is 25% higher.

GYROLOK

Risk of paraffin contamination

SAGANA

To avoid '*risk of contamination*' items should be order as "oxygen degreased" (= acetone baths).

Price: + 20%

**Mount system following clean procedures: protective clothing, clean storage, no open ends, etc**

**Follow manufacturer directions to the letter**

**Never mix one brand or metal with another one**

**BASICS**

# Piping

## Plastic Pipes: PTFE, NYLON, PVC, PU, etc

High gas permeability  
High desorption rate

Insulating

Elastic

Cheap

Low density

- **Metal Pipes: Copper, Stainless Steel**

Expensive

Difficult handling

0 gas permeability

0 outgassing

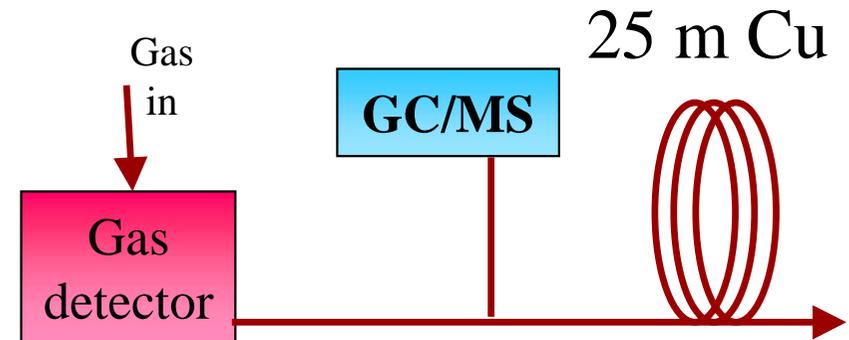

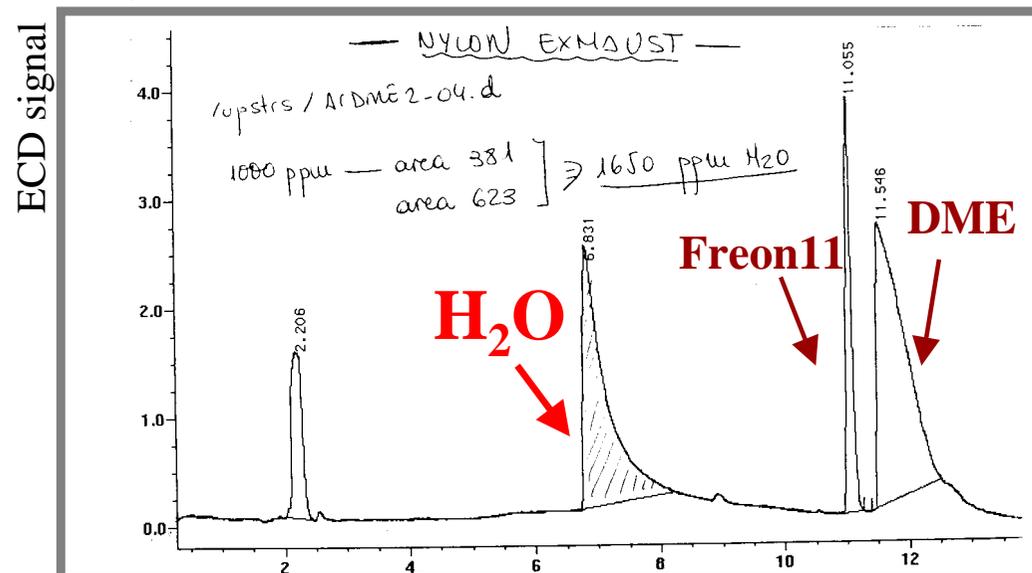

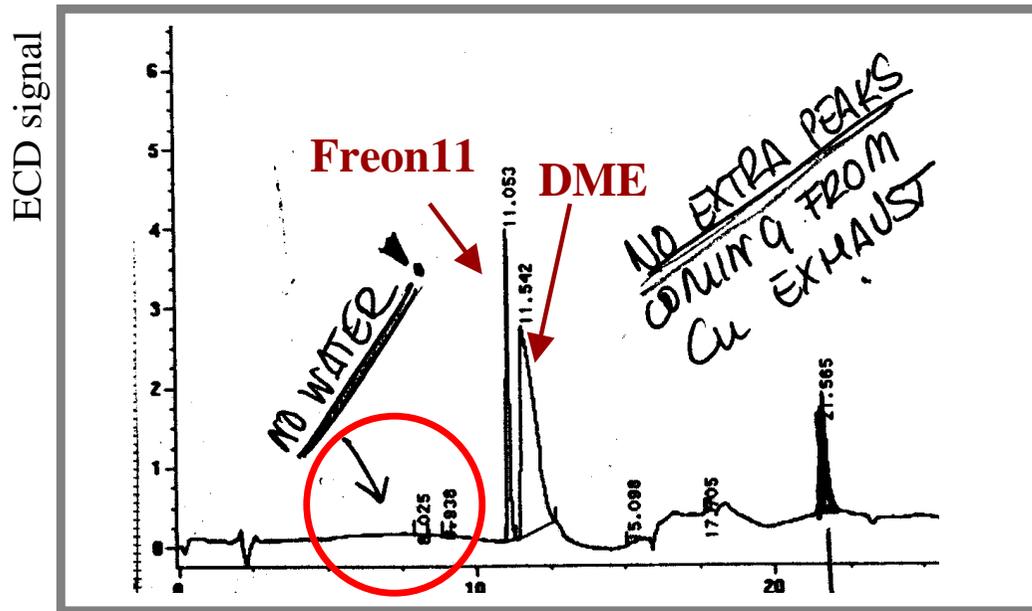

**CLEANING**

## Outgassing Tests of Plastic Pipes

GDD Group

<b>EPDM</b>	Copolymer ethylene propylene	YES	-	<b>BAD</b>
<b>PVDF</b>	Fluorinated polyvinylidene	YES	-	<b>BAD</b>

## About system components...

---

- It is common to find that manufacturing specifications and **product descriptions do not contain enough information.**
- Once an adequate product has been found, it is difficult to assess the **cleanliness conditions for large quantities.**

## The Golden Rule

---

- **Define your cleanliness requirements**
- **Avoid pollution during assembly**
- **Flush gas through the open system**

**AS SOON AS POSSIBLE  
AS MUCH AS POSSIBLE**

# Influence of Some Gases on Ageing

---

**Hydrocarbon mixtures**

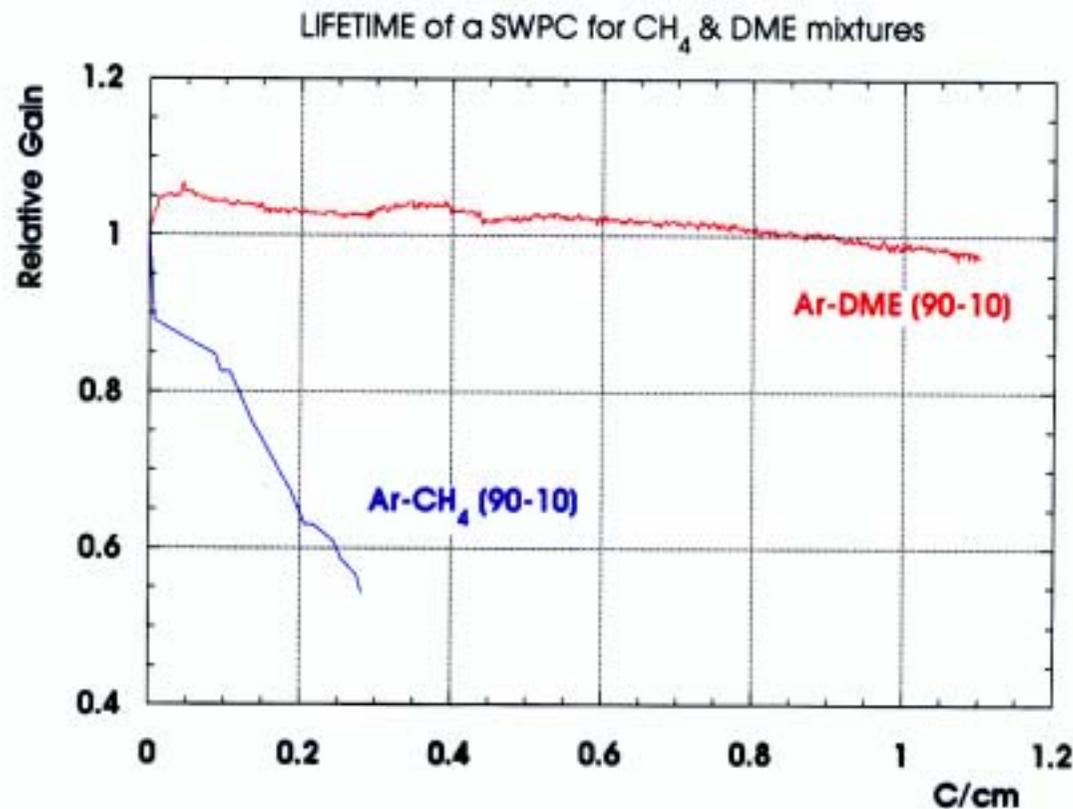

**DME & CO<sub>2</sub>**

**CF<sub>4</sub>**

# Hydrocarbons

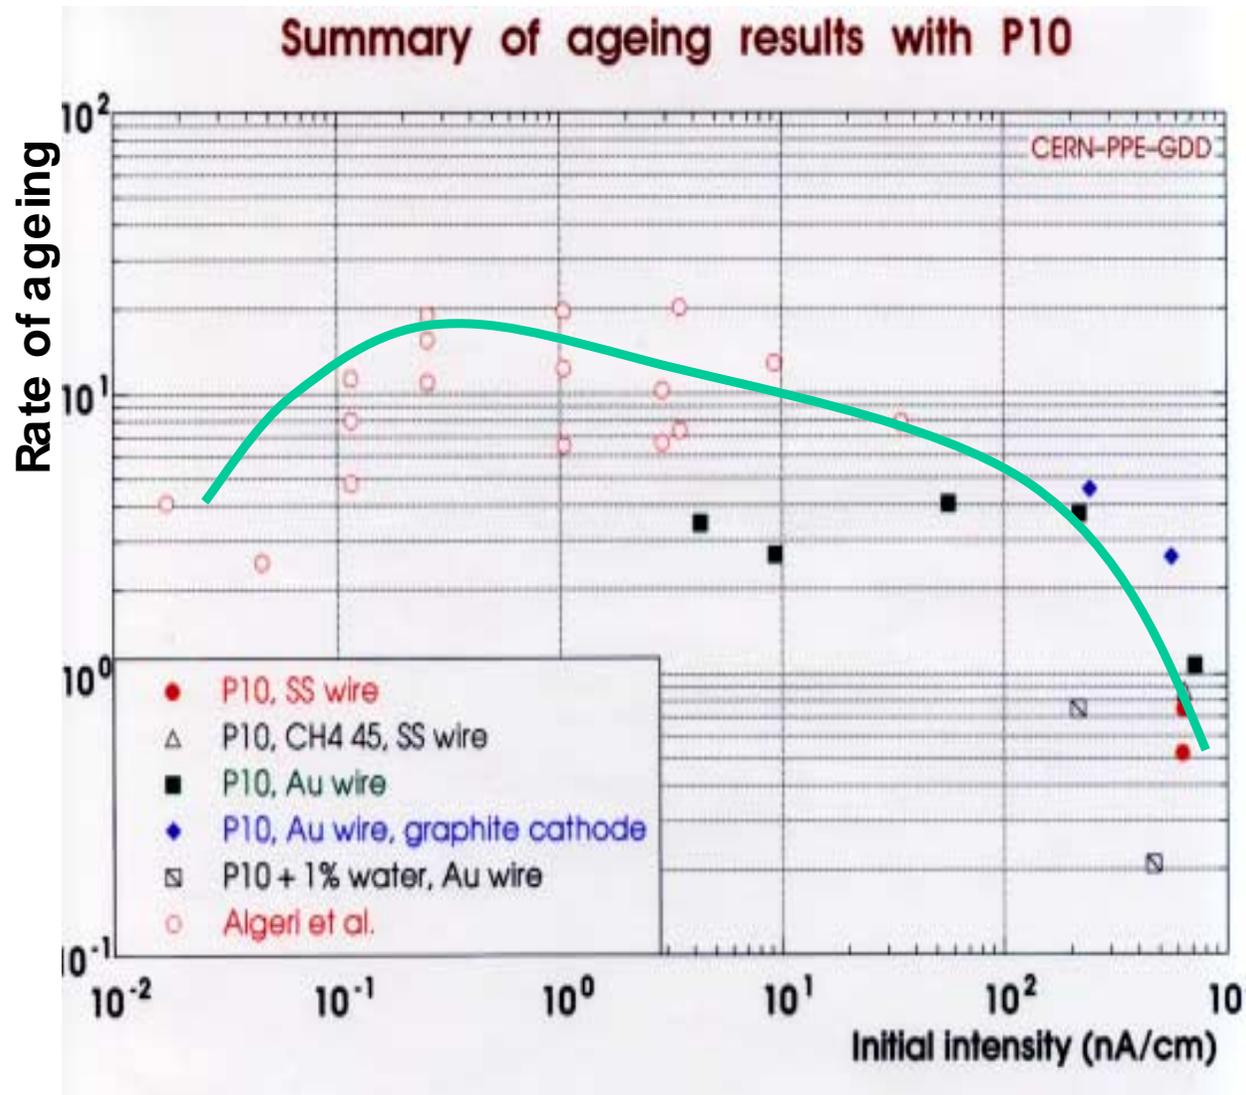

## Polymerization guaranteed

- Polymer formation directly in the avalanche process.
- Effect is more pronounced under spark/discharges.

GDD Group  
CERN

# Hydrocarbons

## RATE OF AGEING:

- ✓ It depends on the charge collection rate.
- ✓ It is independent of electrode material & purity of methane for a given set of irradiation conditions.
- ✓ It improves if water (% level) is added.

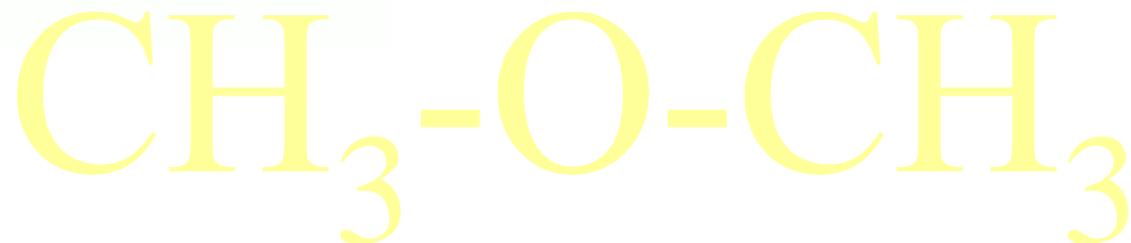

# DME

## Advantages

- Small Lorentz Angle
- High primary ionization
- Low Z
- Good quenching properties (safe operation at high gains)
- Wide efficiency plateau
- Rad hard

## Disadvantages

- DME is very reactive
- Sensitive to traces of pollutants

# DME

**DME is reactive.** A careful selection of materials for detector construction and gas system is mandatory.

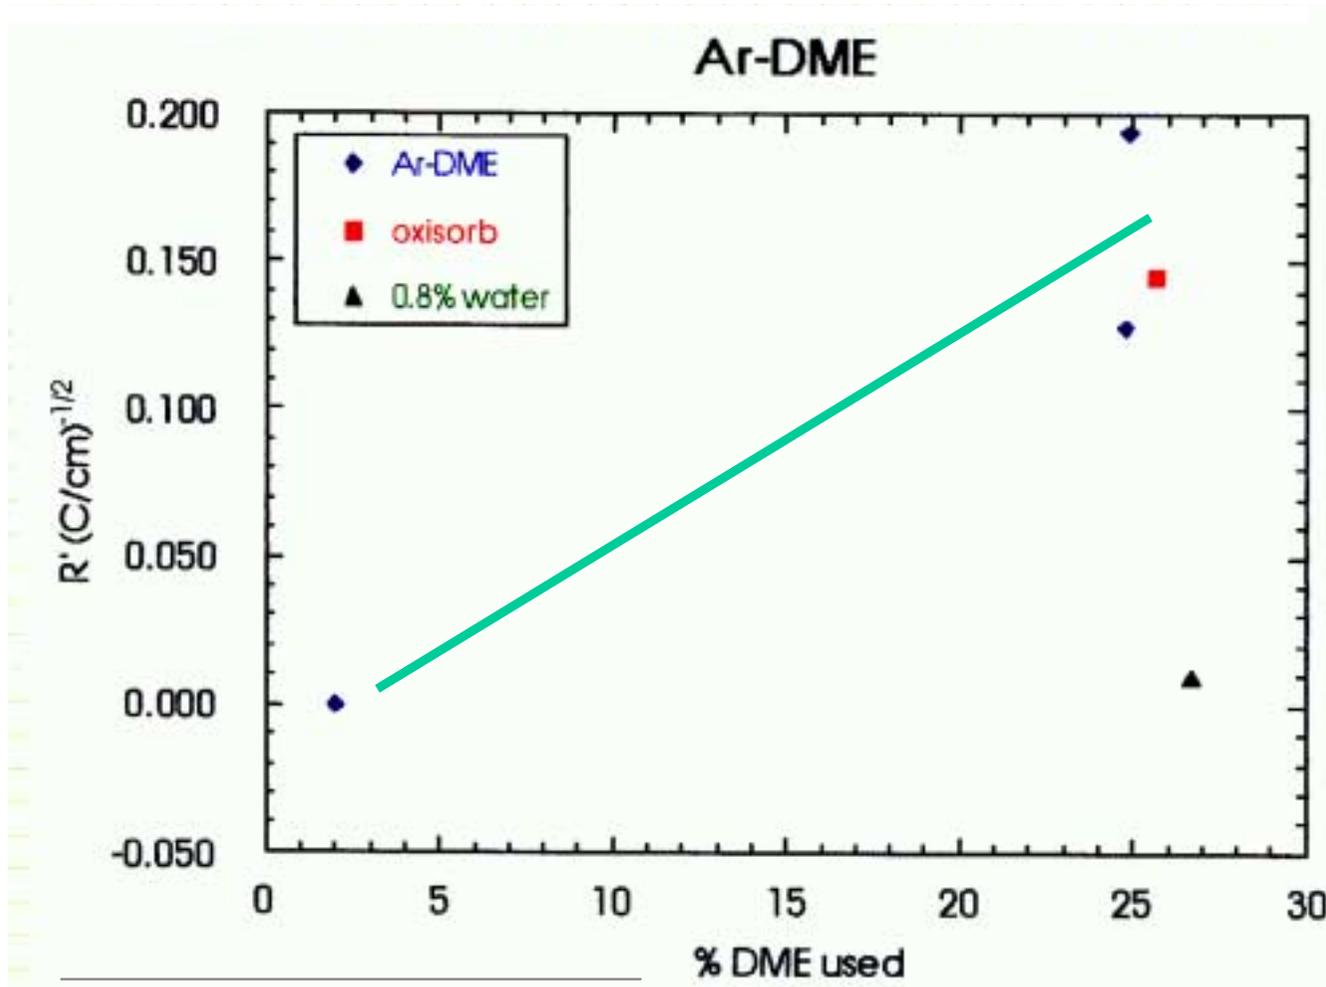

**SWELLING (%)  
in liquid DME  
for 2 hours**

LDPE (foil)	- 0.6
<b>Vectra</b>	<b>0.0</b>
<b>PEEK Cryst. (pipe)</b>	<b>+ 0.3</b>
<b>Kalrez (joint)</b>	<b>+ 1.6</b>

<b>Kel-F (joint)</b>	<b>+ 4.0</b>
<b>PCTFE (joint)</b>	<b>+ 4.0</b>
<b>PVDF (joint)</b>	<b>+ 5.0</b>
<b>Kapton (foil)</b>	<b>+ 5.4</b>
<b>PEEK Amorp. (pipe)</b>	<b>+ 8.7</b>

S. Ilie  
CERN

# DME

## Ageing rate as a function of DME cylinder consumption

Pollutants in cylinder  
at ppm level:

↑ Ethene  $C_2H_4$

1-propene  $C_3H_6$

1-butene  $C_4H_8$

Air

F12 ( $CCl_2F_2$ )

● F11 ( $CCl_3F$ )

↓ Water

### Other Possible Pollutants:

Material outgassing (Teflon, PVC, Neoprene, Viton, etc), residuals of cleaning solvents, etc

# DME

---

- **High sensitivity to traces of pollutants** at ppb level (difficult to control)
- **High reactivity with materials** (such as Kapton, widely used in Micro-pattern Gas Detectors)

**DME has been widely replaced by  $\text{CO}_2$  the cost being:**

Increase of High Voltage

Larger energy of discharges

# CF<sub>4</sub>

---

## Attractive properties

(even for mixtures with  
a relatively small fraction of CF<sub>4</sub>)

- Very high e<sup>-</sup> drift velocities
- Low diffusion constant
- High primary ionization
- Good ageing properties

## Disadvantages

- Etching properties
- Cost (implies gas recirculation for large systems)
- Low E-resolution due to e<sup>-</sup> attachment

# CF<sub>4</sub>: Etching/Deposition balance

Plasma processing: CF<sub>4</sub>-based gases are used for both etching and deposition processes.

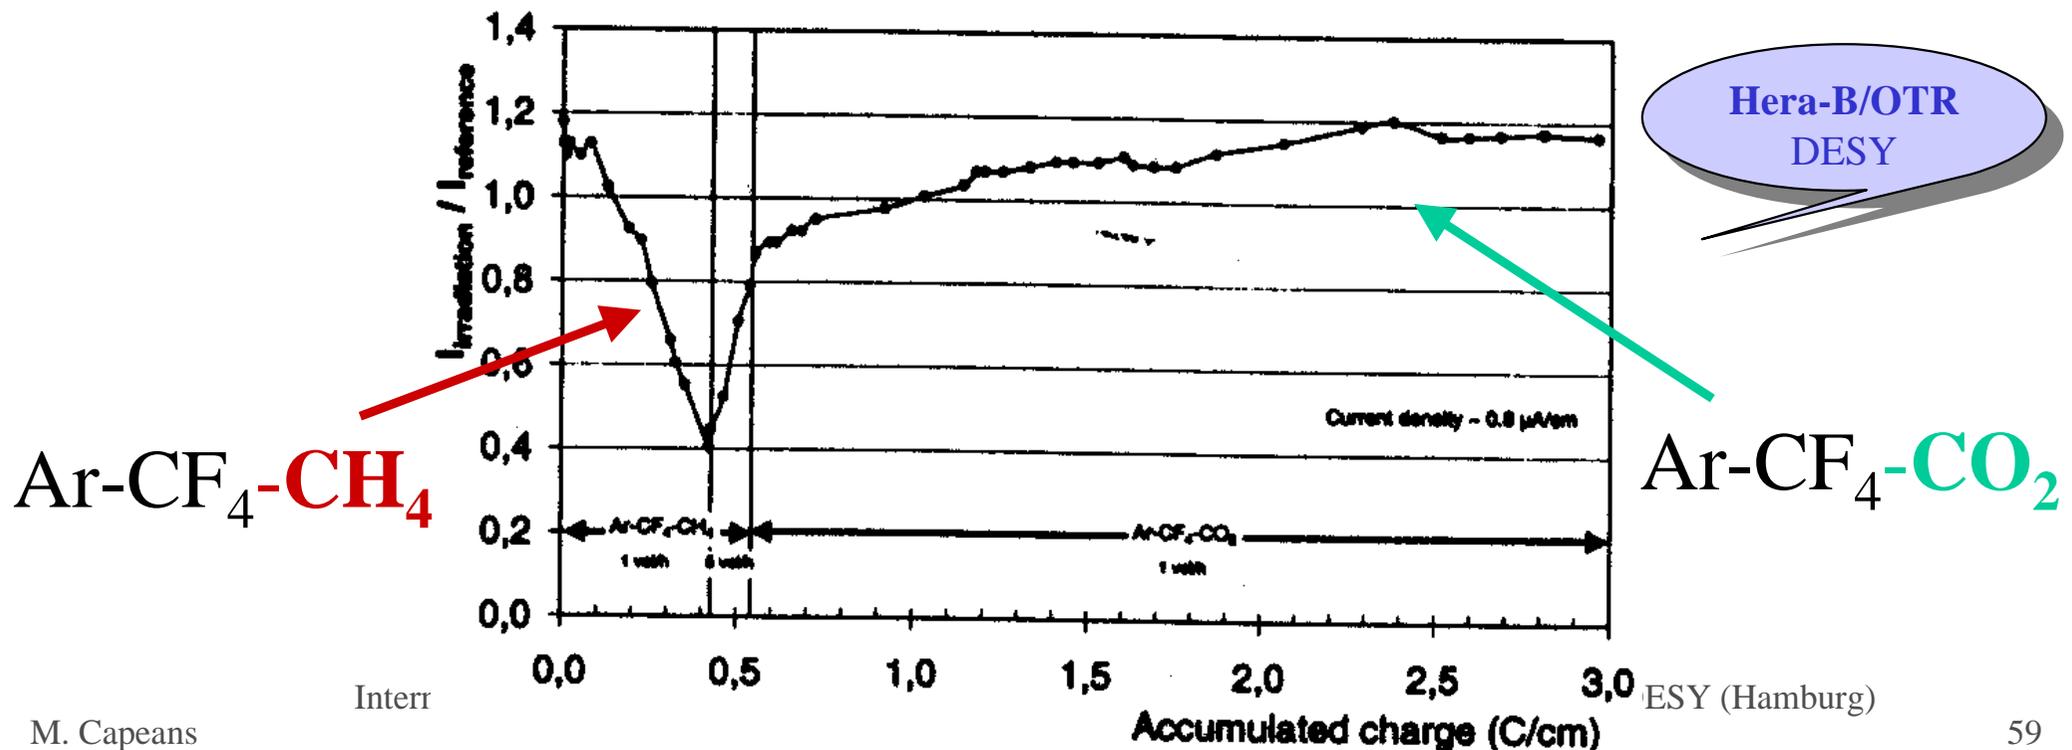

Chemistry is shifted to:

Deposition

in hydrogenated atmospheres

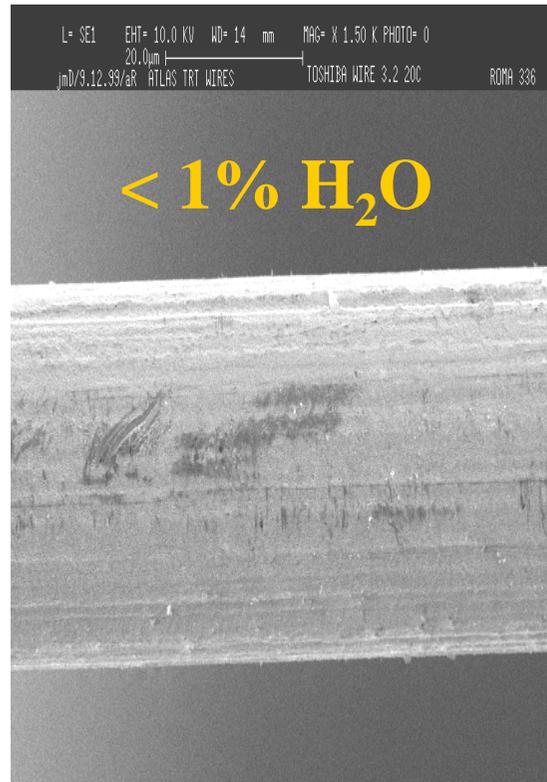

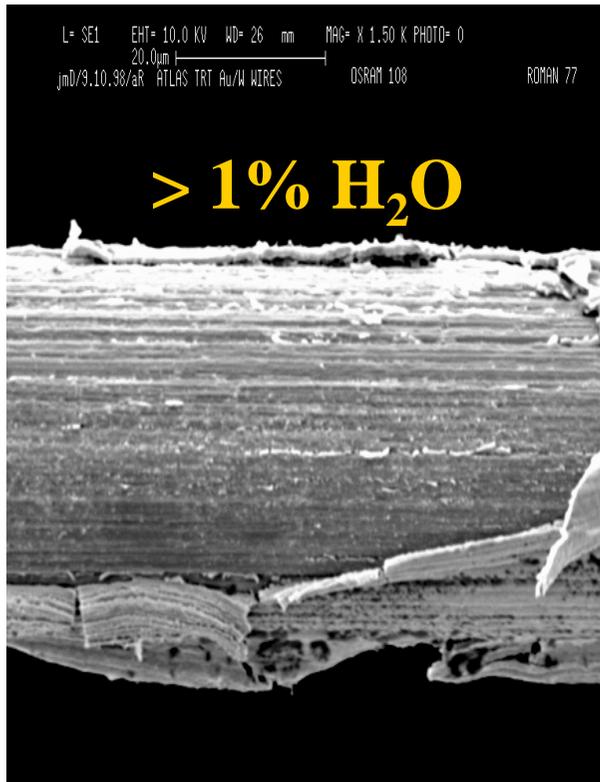

Etching

if oxygenated species are added

# Effect of Water on $\text{CF}_4$ -mixtures

Au/W wire

ATLAS/TRT  
CERN

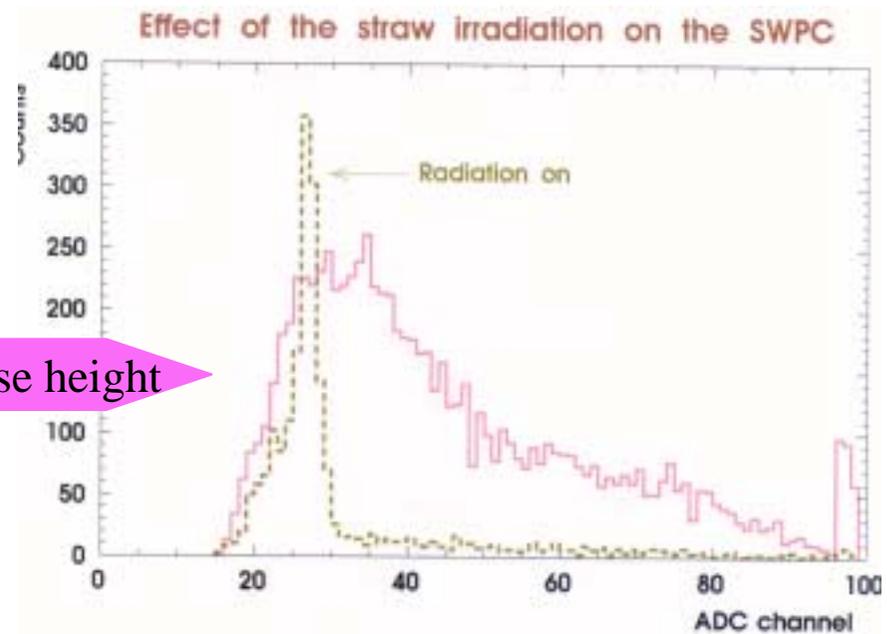

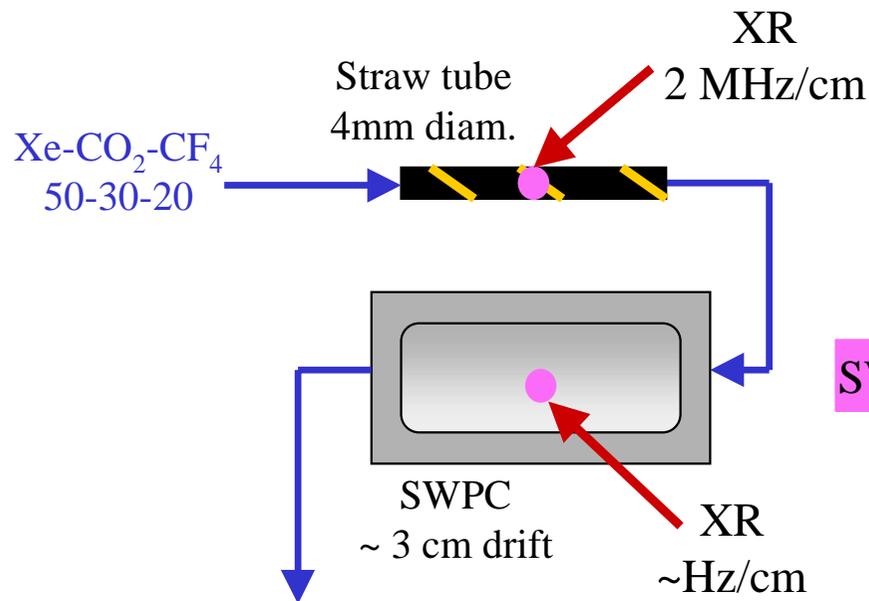

$\text{CF}_4$

**Strict  
Control of  
Pollutants**

**20 C/cm**

# CF<sub>4</sub> Etching

- CF<sub>4</sub> dissociates in F and CF<sub>x</sub> radicals (~ stable species).

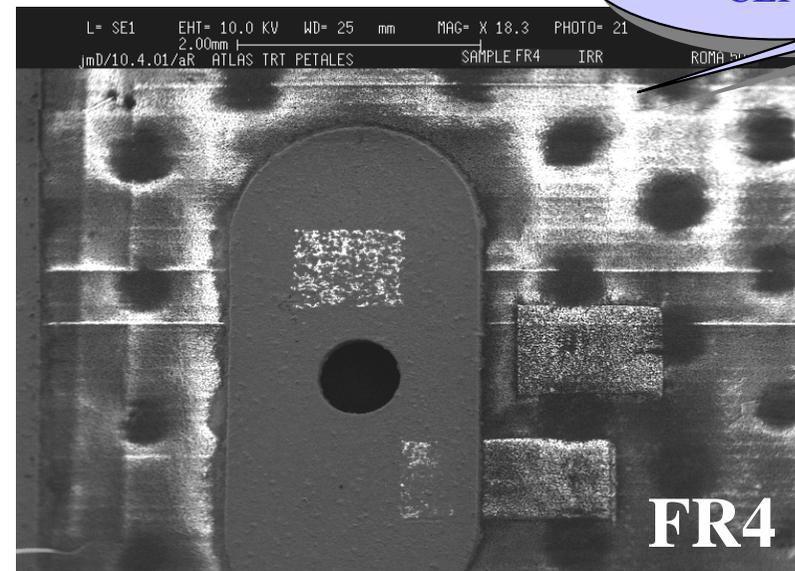

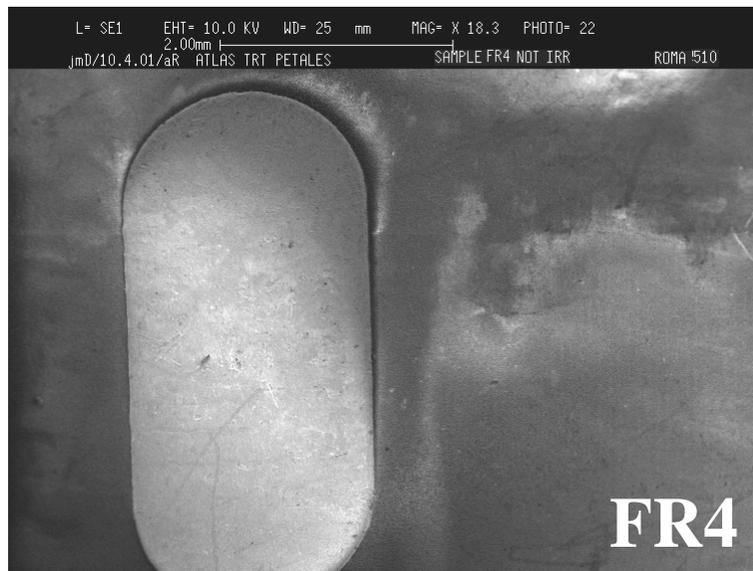

SWPC Pulse height

- They have enough energy to break chemical bonds in polymers.
- Polymer is reduced to stable, volatile products.
- These products are removed from electrodes by the gas flow.

# CF<sub>4</sub> Etching

## Effect on assembly materials:

- Active species **react** with some metals (Al, Tin) and some insulator materials (Fiberglass).
- F species react with **Si**, which is **distributed all around** (polymerization trigger)

ATLAS/TRT  
CERN

**After radical exposure**

# Materials and gases: How to build invincible detectors and gas systems

---

**Extensive R&D is needed,**  
as the experience of other groups is useful  
but has only a **pre-selective** character.

# Detector R&D

---

- **Efficient R&D defines:**
  - **Gas mixture**
  - **Gas purity**, which implies also careful selection of gas system components (test stations & final system)
  - **Gas gain**
  - **Assembly materials**
  - **Assembly procedures** (avoid user-generated contamination)
- The **long-term capability** of a detector can only be extrapolated to real conditions if final prototypes are:
  - Tested under conditions as close as possible to the final ones, and strictly controlled
  - Large irradiation area & charge density as close as possible to final experiment

# Conclusions on Materials

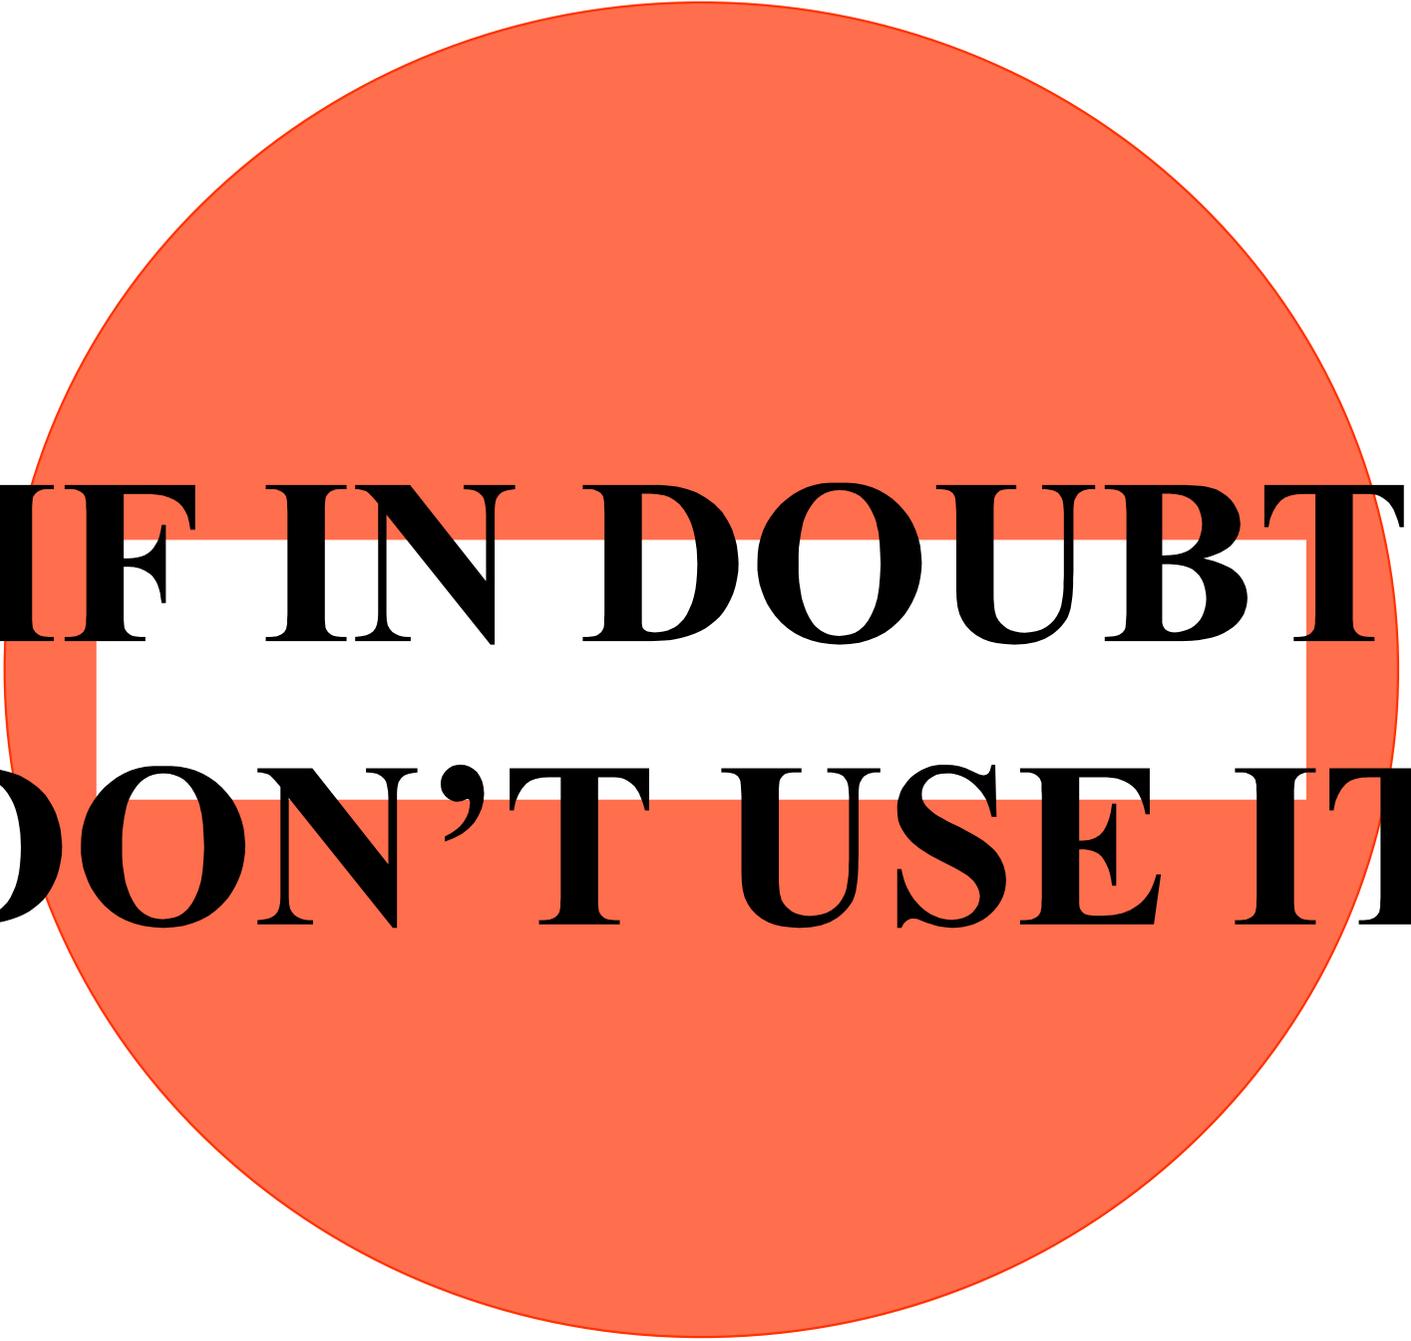

---

- There is no good or bad material. A **material is adequate** or not for a very particular type of detector and conditions of use.
- Existing data, obtained either from systematic outgassing studies or experience gained with detectors, has only a **pre-selective character**.
  - A list of **low outgassing assembly materials** exists, that includes epoxy compounds, rigid materials, sealants, elastomers, ...
  - The effect of **materials that outgas at the ppm level** has to be tested for each particular case. That is the case for materials such as Viton, Teflon, Polyurethane, etc
- It seems rather universal that **Silicone compounds** that easily migrate (lubricant-type) should be avoided, especially with some gas mixtures (F species).

# Conclusions on Gases

---

- Noble Gas + **Hydrocarbon**:
  - Not trustable for long-term high rate experiments
  - It is accepted that oxygen containing additives can improve detector lifetime in such mixtures
- Noble Gas + **DME**:
  - They are radiation hard when careful material selection has been done
  - Halogen contamination at ppb level shortens detector lifetime. It is difficult to monitor
- **CF<sub>4</sub>**-containing mixtures:
  - They are very attractive in terms of ageing due to the fine polymerization-deposition balance phenomena
  - They need strict **control of pollutants** (H<sub>2</sub>O)
  - F-radicals are rather stable and able to attack some materials. They are capable of etching away Si-compounds that may trigger strong polymerization processes

**IF IN DOUBT  
DON'T USE IT**
