

REVIEW OF WORKSHOP RESULTS ON THE FUNDAMENTAL UNDERSTANDING OF AGING PROCESSES

Fabio SAULI

Fabio SAULI
CERN

WHAT?
ANOTHER SUMMARY?

International Workshop on Aging Phenomena in Gaseous Detectors
October 2-5, 2001 at DESY, Hamburg

F. SAULI

AGING 2001

FOREWORD

SUMARIZING 50 AND MORE TALKS AND POSTERS IN 50 MINUTES IS A STRENUOUS TASK. MOREOVER, THERE HAVE BEEN SEVERAL OTHER INTERMEDIATE SUMMARIES AND SUMMARY TABLES ALL ALONG THE WORKSHOP; ONE MORE, 3-DIMENSIONAL SUPER-SUMMARY WOULD BE BORING AND USELESS.

I HAVE TRIED INSTEAD TO SORT OUT FROM THE CONTRIBUTIONS THOSE SUGGESTIVE OF STILL OPEN PROBLEMS OR POSSIBLE INNOVATIVE SOLUTIONS TO THE CENTURY-OLD PROBLEM OF PROPORTIONAL COUNTER AGING. IN DOING THIS SELECTION, I HAD TO NEGLECT SOME VERY GOOD WORKS, PARTICULARLY CONCERNING THE SUCCESSFUL DESIGN AND OPERTATION OF LARGE EXPERIMENTS; I APOLOGIZE IN ADVANCE FOR ALL OMISSIONS. THE READER WILL FIND THESE CONTRIBUTIONS IN THE DETAILED TALKS.

DETECTORS AGING *PHYSICS or BIOLOGY ?*

F. SAULI

AGING 2001

EARLY WARNINGS 1: DEGENERACY OF GEIGER COUNTERS:

Gas filling: pure CH₄

Heavy deposits observed on anodes

F. SAULI

E. C. Farmer and S. C. Brown, Phys. Rev. 74 (1948) 902

AGING 2001

EARLY WARNINGS 2: DETERIORATION OF PROPORTIONAL COUNTERS WITH IRRADIATION:

Ar-CH₄ 90-10
12.μm anode wire Ø

C- rich deposits
CH-chain polymers

Increase of wire diameter for
50% gain reduction: ~ 1 μm

F. SAULI

A. Den Boggende et al, J. Scient. Instr. Ser. 2 Vo.I 2 (1999) 701

AGING 2001

DEGRADATION OF MWPCs (AGING)

RATE-DEPENDENT SHIFT OF COUNTING RATE AND DISCHARGE VOLTAGE

Anode wire deposits:

Lower gain

Cathode deposits:

Electron emission (Malter effect)

G. Charpak et al,
Nucl. Instrum. Methods 99 (1972) 279

F. SAULI

AGING 2001

THE ANODE WIRE DEPOSITS SAGA

F. SAULI

AGING 2001

DEPOSITS

ANODE WIRE DEPOSITS DECREASE THE GAIN:

DIRECTLY (CONDUCTING DEPOSIT)
OR INDIRECTLY (DIPOLE CHARGING UP)

CATHODE DEPOSITS INDUCE DISCHARGES:

POSITIVE IONS ACCUMULATION CREATES
HIGH DIPOLE FIELD, INDUCING ELECTRON
EXTRACTION (MALTER EFFECT)

WHISKERS

Aging Studies in a 100 MeV alpha-beam Ar/CF₄/CH₄(74:20:6)

Operating conditions:

- α -beam area $8 \times 8 \text{ cm}^2$
(Irradiation of 4 wires fully, 2 wires exposed over half of their cell width)
- HV=2.35 kV, gas gain $\sim 4 \times 10^4$
- current density $\sim 250 - 750 \text{ nA/cm}$
- Gas flow $\sim 5 \text{ l/h}$

Total collected charge $\sim 280 \text{ mC/cm}$:

Gain reduction was observed after $\sim 60 \text{ mC/cm}$

Wire irradiated over half
of their cell width

Fe⁵⁵ source
R ~ 8 %

HERA-B
environment

SILICA FIBRES

Unprocessed wire silica fibrils

M. Binkley

Unprocessed gas from the new vendor: 1400 ppm ethylene, 1100 ppm propylene, 600 ppm propane. Wire aged to 30% gain loss (about 0.13 coulomb/cm).

10
10KV 29mm

WHISKERS GROWTH

Model of film creation and growth

1. The main part of electrons and negatively charged polymers from avalanche reach sense wire surface on peaks and process of polymer film formation start on the surface of peaks in the regions with highest electric field strength. ($S_{eff} < S_{wire}$)

Polymers fibers on early stage of growth

DEPENDENCE OF PLASMA POLYMERIZATION 1

Dependence of deposition rate on operational parameters and domains of plasma polymerization

Dependence of deposition rate of plasma polymer of tetramethyldisiloxane on discharge wattage at the flowing monomer flow rates (cm³/min).

Dependence of deposition rate of the plasma polymer of tetramethyldisiloxane on discharge power at a fixed flow rate

Dependence of deposition rate of the plasma polymer of tetramethyldisiloxane on W/FM at different flow rates

Dependence of plasma polymerization domains on deposition rate and W/FM at various flow rates.

DEPENDENCE OF PLASMA POLYMERIZATION 2

Each Element Has Its Own Characteristic Polymerization Rate

Cascade Arc Reactor

Reactive Species in Normal Plasma and LTCAT

J. Va'vra, DIESY workshop, October 2, 2001

Wire Chambers vs. Plasma Chemistry

λ - Mean free path between the electron collisions ($\sim 1\mu\text{m}$)
 τ - Mean free time between collisions ($\sim 1\text{ps}$)

Parameter	Plasma Chemistry [4]	Wire Chambers
Average Electron Energy	1 - 10 eV	5 - 10 eV (Ar)
Effective Volume	100 - 1000 cm ³	10 ⁻¹⁰ - 10 ⁻⁸ cm ³
Typical Electron Density	10 ⁷ - 10 ¹⁷ e/cm ³	10 ¹⁴ - 10 ¹⁷ e/cm ³ /avalanche
Typical Power Density	0.01 - 10 watts/cm ³	10 ⁸ - 10 ¹² watts/cm ² /avalanche
Gas Pressure	0.01 - 10 Torr	$\geq$ 760 Torr
E/p	10 - 50 V/cm-Torr	100 - 400 V/cm-Torr (on the surface of the anode)
Type of Electric Field	RF	DC
Typical Gas Flow	$\sim$ 1 Gas Volume/1-10 minutes	$\sim$ 1 Gas Volume/1-8 hours

(J.Va'vra, NIM A252(1986)547)

- Parameters are vastly different in the two fields.
- Yet, in retrospect, some conclusions from the Plasma Chemistry proved to be directly applicable to our field.
(For example, a role of H₂O, O₂ or oxygen-based additives)

PESTOV COUNTERS

SECONDARY AVALANCHE PROPAGATION (DELOCALIZATION)

F. SAULI

FUNDAMENTS OF AGING STUDIES

AGING DEPENDS ON TOTAL COLLECTED CHARGE Q:

$$Q = M R T n e \quad (GAIN \times RATE \times TIME \times PRIMARIES)$$

Coulombs/cm of wire or strip (MWPC, MSGC)

Coulombs/ mm² or /cm² (PPAC, RPC, μ M, GEM...)

“INVARIANT” AGING PARAMETER:

$$R = -\frac{1}{Q} \frac{\Delta A}{A} \quad (J. Kadyk, \sim 1985)$$

IMPLICIT ASSUMPTION:

AGING RATE DOES NOT DEPEND ON
GAIN
ELECTRIC FIELD STRENGTH
DOSE RATE
IONIZATION DENSITY
TYPE OF PARTICLE
GAS FLOW...

F. SAULI

AGING 2001

DOSE RATE DEPENDENCE

DEPENDENCE ON WIRE DIAMETER (SURFACE FIELD?)

J. Va'vra, October 2, 2001

- Aging rate as a function of wire diameter

(J. Va'vra, NIM A387(1997)183)

- To be able to measure a finite result, choose molecules where the aging is reasonably fast.
- Both of these molecules leave a smooth film on the surface

F. SAULI

AGING 2001

Possible Beams: Hadronic Sources

Facility Radiation Type	Radiation Density	Radiation Density	Irradiation area	Gas Mixture	Effect seen?
Rossendorf Protons 13 MeV/c	5 mC/cm	0.3 μ A/cm	$\sim 9 \times 9$ cm ²	Ar/CF ₄ /CH ₄	NO
Rossendorf α -part, 28 MeV/c	3 mC/cm	0.6 μ A/cm	$\sim 1 \times 3$ cm ²	Ar/CF ₄ /CH ₄	NO
PSI p 70 MeV/c	$\sim$ mC/cm	0.2 μ A/cm	$\sim 0.5 \times 0.5$ cm ²	Ar/CF ₄ /CH ₄	NO YES*
PSI π /p 350 MeV/c	$\sim$ mC/cm	0.02 μ A/cm	$\sim 12 \times 22$ cm ²	CF ₄ /CH ₄	YES
Karlsruhe α -part, 100 MeV/c	$\sim$ mC/cm	0.02 μ A/cm	$\sim 7 \times 7$ cm ²	Ar/CF ₄ /CH ₄	YES
HERA-B P(920 GeV)-N	$\sim$ mC/cm	0.03 μ A/cm	100x30 cm ²	All gas mixtures	YES

* Effect could be ignited increasing the irradiation area

A chamber in which the **cathode** was **coated with carbon** spray did not show Malter effect

F. SAULI

AGING 2001

The Gas Electron Multiplier as a Charge Amplification Stage

The GEM Principle:

- + High voltage on electrodes (0.3-0.5kV)
- + Fieldlines from the volume above the GEM are strongly compressed into the holes:
 - > High fields inside the holes
 - > **Proportional Gas Amplification**
- + A big part of the fieldlines are decompressed into the volume below the GEM,
 - > High electric transparency
 - > Effective gains up to 10^3

Electron drift lines through a GEM

GDD, CERN, Geneva (Switzerland)

IEKP, Karlsruhe University (Germany)

Previous Aging Measurements with a Double-GEM Detector

Former Studies:

- + Double-GEM detector,
standard GEMs & PCB readout
- + Detector operated with
 - Ar:CO₂ (70:30)
 - Effective gain $G = (2.2 \pm 0.4) 10^3$
 - $E_D = 2.0 \text{ kV/cm}$,
 - $E_T = E_I = 4 \text{ kV/cm}$
 - GEM voltage: 410/410V
- + 6keV X-ray tube, 2cm² irradiated
- + SWPC for reference,
installed in the same gas line

LIFETIME OF RADICALS

Lifetimes of radicals

intensity = $0.6 \mu\text{A}/\text{cm}$

	Reaction	Constant
	$\text{CF}_3 + \text{F} + \text{M} \rightarrow \text{CF}_4 + \text{M}$	0.1 s
	$\text{F} + \text{F} + \text{M} \rightarrow \text{F}_2 + \text{M}$	25 s
	$\text{CF}_3 + \text{CF}_3 + \text{M} \rightarrow \text{C}_2\text{F}_6 + \text{M}$	0.046 s
concent ↓ n=100 ppm	<u>$\text{H}_2\text{O} + \text{F} \rightarrow \text{HF} + \text{OH}$</u>	$2 \times 10^{-5} \text{ s}$
	$\text{OH} + \text{OH} \rightarrow \text{H}_2\text{O} + \text{O}$	0.8 s
	$\text{F} + \text{OH} \rightarrow \text{HF} + \text{O}$	0.014 s
n=5%	$\text{F} + \text{O}_2 + \text{M} \rightarrow \text{FO}_2 + \text{M}$	4 s
	$\text{F} + \text{CH}_4 \rightarrow \text{HF} + \text{CH}_3$	$1.8 \times 10^{-9} \text{ s}$
	M $\equiv$ collision partner (argon)	

★ F rapidly reacts with water $\Rightarrow$ *probably F is responsible for etching.*

★ $I_{\text{F}} \approx I_{\text{HF}} \approx 0.6 * I_{\text{e}}$

EFFECT OF GAS FLOW 1

Ar/CF₄/CH₄(67:30:3) + 500 ppm H₂O

Wires irradiated at 2.65 kV (2.6 kV, gain $\sim 10^5$) started to show gain reduction and dark currents above a collected charge of 25 mC/cm (80 mC/cm):

Wire irradiated at 2.6 kV:

Total collected charge ~ 400 mC/cm:

- Efficiency decreases in the direction of the serial gas flow
- Wire deposits, containing only C and F elements (H is not observable)

M. Titov

EFFECT OF GAS FLOW 2

KAPTON STRAWS Ar-CO₂-C₂H₂F₄ 40-40-20

Figure 5. Gas gain distribution along the straw for different accumulated doses. The gas gain was estimated as a ⁵⁵Fe source pulse spectrum peak position in units of the charge integrated for $\tau = 1 \mu\text{sec}$ and measured in the test points presented in Fig.2.

F. SAULI

AGING 2001

BEST SOLUTION: A COLD TRAP?

F. SAULI

AGING 2001

M. Binkley

MALTER - NO ADDITIVES

Additive: None.

The small pulse response to a step current in an aged chamber is shown for several anode currents. The ratio starts at a .025 base level, and then increases rapidly at higher anode currents to Malter breakdown, as indicated by the star symbol on boundary. An anode current of $\leq 0.3 \text{ nA/cm}$ is stable.

A. Boyarski

WATER ADDED

Additive: H₂O

Small Pulse Response to Step Current
80:20 Gas + Water

PROPANOL ADDED

Additive: 2-Propanol

Small Pulse Response to Step Current
80:20 Gas + 2-Propanol

Solution and Effects

- Added water to the gas mix
 - Tripping seems cured
 - Ongoing test really
 - Operating parameters shifted and required adjustment

D. Bailey

Implications for the Gas System

Clear dependence with the water content in the gas

Surface conductivity in the supporting bridges strips can be avoided by carefully controlling the gas water content (< 500 ppm)

F. SAULI

AGING 2001

Water Admixture (0.3%)

“super clean” GEM-MSGC

MSGC structure: gold
frame material: glass
drift electrode: glass, gold
filling gas: Ar/DME (50/50)
pre-mixed DESY
 $\pm 0.3\% \text{H}_2\text{O}$
particle flux: $20 \cdot 10^3 \gamma/\text{mm}^2\text{s}$

- experience in long term measurements:
increased running stability, but massive anode ageing ...

F. SAULI

AGING 2001

Influence of H₂O Content on Discharge Probability

Laboratory Studies

Measurement:

- + Discharge prob. in presence of heavily ionizing γ -radiation
- + Double-GEM detector
- + Detector operated with
 - Ar:CO₂ (70:30)
 - $E_D = 3.0 \text{ kV/cm}$,
 - $E_T = E_I = 3.5 \text{ kV/cm}$

F. SAULI

AGING 2001

IEKP, Karlsruhe University (Germany)

CF₄: ETCHING/DEPOSITION 1

Plasma processing: CF₄-based gases are used for both etching and deposition processes.

Chemistry is shifted to:

Etching

if oxygenated species are added

Deposition

in hydrogenated atmospheres

Au/W wire

**Strict
Control of
Pollutants**

M. Capeáns

CF₄: Etching/Deposition balance

Plasma processing: CF₄-based gases are used for both etching and deposition processes.

Chemistry is shifted to:

Deposition
in hydrogenated atmospheres

Etching
if oxygenated species are added

CF₄ AGING

Ar/CF₄/CH₄(67:30:3)

Two wires irradiated at 2.25 kV up to:
100 mC/cm Ar/CF₄/CH₄+500 ppm H₂O
100 mC/cm Ar/CF₄/CH₄+1400 ppm H₂O

No gain reduction for one wire,
Si-based deposits on the other
(maximum gain reduction is in the
region of lowest radiation intensity)

EDX SPECTRUM (20 kV)

Four wires irradiated at 2.5 kV, 2.55 kV up to:
400 mC/cm Ar/CF₄/CH₄+500 ppm H₂O
400 mC/cm Ar/CF₄/CH₄+1400 ppm H₂O

No gain reduction for all wires after 800 mC/cm,
several distinct spots on the wires with gas gain
loss after 400 mC/cm, which afterwards vanished

EDX SPECTRUM (20 kV)

M. Titov

F. SAULI

AGING 2001

Recovery: Exchange CH₄ – CO₂

Start irradiation after gas exchange

A chamber previously irradiated with Ar/CF₄/CH₄ that showed fast anode aging and Malter effect was **completely recovered** after several hours of **irradiation with Ar/CF₄/CO₂** (CF₄ wire and cathode etching??)

F. SAULI

AGING 2001

NO WATER-WIRE BREAKS

Wire ruptures
in X-ray tests with
different humidity

dose C/cm	H ₂ O (inp/outp) ppm	O ₂ (inp/outp) ppm	ruptures
0.55	<10/50	30/200	yes, after 0.3 C/cm
1.2 straws	<10/100	30/200	yes, after 0.6 C/cm
4.5	350/400	30/200	no
3.5	700/750	30/300	no
1.2 used ch.	<10/80	30/250	yes, after 0.28 C/cm
1.2	<10/120	30/250	yes, after 1.2 C/cm

A. Schreiner

- * Wire ruptures after 0.3 C/cm (1/2 years in HERA-B) in dry chambers ($H_2O < 100$ ppm)
- * No aging effects until 5 C/cm in relatively humid chambers ($H_2O > 300$ ppm)

TUNGSTEN WIRE SWELLING 1

Figure 4: The results of SEM/XEM examination of the wire surface along the wire. Reference part of the wire surface is smooth and undamaged (Fig.4a). XEM analysis of the wire surface, presenter in Fig.4b and 4d, shows that deposits contain a large amount of oxygen and tungsten.

AGING 2001

T. Ferguson, G. Gavrilov et al

WIRE SWELLING

GOLD DAMAGE 1 Gold-damage effects: Reason

OSRAM wire, 3 % Au

Standard mixture +1.2% H₂O and 1.5% O₂

Total dose: **0.5 C/cm**

Luma wire, 5 % Au,

Ni-substrate

Standard mixture +1.2% H₂O and 1.5% O₂

Total dose: **~3 C/cm**

Presence of molecular Oxygen makes processes more complicated!

GOLD DAMAGE 2 Gold-damage effects: Reason

Toshiba W wire (1 μm Au)
Standard mixture +1.2% H_2O
6.5 C/cm

Toshiba W wire (1 μm Au)
Standard mixture +1.5% O_2 (NO H_2O)
6.5 C/cm

TRT STRAWS 3

Effect of Si-based lubricant initially used for the straw production

Monitoring straw

Counting rate ~5 kHz/cm:~ 20 times less than at LHC)

Space invaders

Is Earth under attack from hordes of alien bugs?

A THIRD of a tonne of extraterrestrial bacteria could be raining down on Earth every day. The controversial claim comes from scientists who say they have found microbes living more than 40 kilometres above the Earth's surface.

Ever since the 1970s astronomers Fred Hoyle and Chandra Wickramasinghe have backed the idea that Earth was seeded with life from space. They think microbes hitchhike around the Universe on comets. Although the bacteria would spend much of the time frozen, radiation from the Sun would warm a comet's surface when it got close enough, making it shed microbes that might just fall to Earth.

Now Wickramasinghe says he's caught some extraterrestrial bacteria in the act. In January, he and his colleagues at Cardiff University and the Indian Space Research Organisation in Bangalore launched a balloon from Hyderabad in southern India. Strapped to the balloon were several steel containers that were sterilised and evacuated before launch.

As the balloon rose through the atmosphere, the containers collected air samples at four different altitudes over a range of 20 to 41 kilometres. When the balloon landed, four containers with air samples and two unopened canisters were sent to David Lloyd, a microbiologist at Cardiff University.

Lloyd says that no microbes had contaminated the unopened containers. But he found that all four containers that were opened high in the atmosphere contained clumps of bacteria. "We found a mixture

of alive and dead microbes," says Lloyd. The researchers found similar numbers of bacteria clumps at every height they tested. Wickramasinghe told an astrobiology session at an engineering meeting held in San Diego last week. "If this was blown up from the ground, you'd get a tail off at higher altitudes," he says.

He says finding bacteria above 16 kilometres is intriguing because of an atmospheric "barrier" called the tropopause. Here, the atmosphere flips from getting colder with height to getting warmer. This cuts off convection currents that might otherwise carry microbes from the ground into the atmosphere.

"It acts like a lid," adds Ian Colbeck, an aerosols expert at Essex University in Colchester. "The only particles that can get near it are from volcanic eruptions, and bacteria probably wouldn't survive the heat. I can't see any way they'd have their origin on the ground."

Mark Burchell, a planetary scientist from the University of Kent at Canterbury, is more cautious. "There aren't good models for how high bacteria can be swept up," he says. "He may have extended the range of life on Earth, because 41 kilometres would be remarkable. But if it's from space, it'd not just be remarkable, it'd be astonishing."

Wickramasinghe estimates that if each clump of bacteria contains 100 bacteria, one third of a tonne of extraterrestrial bacteria could be falling on Earth every day. He is now trying to grow the microbes he collected and identify them.

IAN SAMPLE

Did life on Earth arrive from outer space?

The Frankenstein method

BOLTS of lightning that strike the ground may help bacteria adapt and evolve.

Experiments suggest that electrical currents help soil bacteria exchange DNA.

Scientists commonly use electricity to increase the permeability of bacterial cell membranes, making it easier to insert DNA. Now Sandrine Demareche's team at the University of Lyon has provided the first evidence that nature may have been wise to this trick all along.

The researchers seeded soil samples

BIG BOLT: Lightning may spark evolution

with the *E. coli* bacterium, as well as fragments of DNA containing genes for antibiotic resistance. They zapped the soil with a simulated lightning strike, and found that many of the bacteria had acquired the resistance genes.

Bacteria are already known to take up and use foreign DNA released into the environment when other organisms die. Scientists knew this "horizontal gene transfer" occurs naturally in soil, but thought it was relatively rare. However, recent genomic research indicates that this gene take-up is widespread and has played a major role in the evolution of the bacterial genome.

"This result might help explain the discrepancy between the very low observed rates of gene transfer and the apparently wide distribution of DNA sequences among bacteria," says team member Timothy Vogel.

Lightning may seem relatively rare, but there are about a hundred flashes a second around the planet. Ground strikes almost always create currents in the surrounding soil similar to those from the simulated bolts, Vogel says. Scott Norris
