HISTORY

A DECADE OF TRACKING STUDIES

1992: *First discussions on detectors in Garmisch-Partenkirchen (LC92).*

Silicon? Gas?

1996-1997: *TESLA Conceptual Design Report. Large wire TPC, 0.7Mchan.*

1/2001: *TESLA Technical Design Report. Micropattern (GEM, Micromegas) as a baseline, 1.5Mchan.*

5/2001: *Kick-off of Detector R&D*

11/2001: *DESY PRC prop. for TPC (European & North American teams)*

• Recommendations of 52nd Meeting of the DESY PRC 25-26 October 2001

PRC R&D-01/03: LC TPC R&D

The PRC recommends the approval of the proposed R&D programme. It encourages the collaboration to perform **high magnetic-field tests** of the different end-plate technologies (**GEM, MICROMEAS** and standard wire chambers).

• Status Report given at DESY PRC meeting 07 May 2003

The PRC congratulates the collaboration for the progress achieved in many areas of the project and looks forward to tests of large area prototypes of the three readout technologies in high magnetic field. The PRC recommends the continuation of the program and looks forward to a status report in Autumn 2004.

Goal

To design and build an ultra-high performance

Time Projection Chamber

*...as central tracker for the ILC detector,
where excellent vertex, momentum and
jet-energy precision are required...*

"Large" Detector example

- Flavor tag $\delta(\text{IP}) \sim 5\mu\text{m} \oplus \frac{10\mu\text{m} \cdot \text{GeV}/c}{p \sin^{3/2} \theta}$
- Track momentum $\delta(1/p_t) \sim 6 \times 10^{-5} \text{ GeV}/c^{-1}$
- Particle Flow $\delta E/E \sim .30 / \sqrt{E}$

Energy flow

- granularity
- hermeticity
- min. material inside caloros
- calor inside 4 T coil

Physics determines detector design

★ momentum: $d(1/p) \sim 10^{-4}/\text{GeV}(\text{TPC only})$
 $\sim 0.6 \times 10^{-4}/\text{GeV}(\text{w/vertex})$
 (1/10xLEP)

$e^+e^- \rightarrow ZH \rightarrow \mu\mu X$ goal: $\delta M_{\mu\mu} < 0.1 \times \Gamma_Z$
 $\rightarrow \delta M_H$ dominated by beamstrahlung

★ tracking efficiency: 98% (overall)

excellent and robust tracking efficiency by combining vertex detector and TPC, each with excellent tracking efficiency

Motivation/Goals

- Continuous tracking throughout large volume
- ~98% tracking efficiency in presence of backgrounds
- Minimum of X₀ inside Ecal (<3% barrel, <30% endcaps)
- $\sigma_{pt} \sim 100\mu\text{m}$ ($r\phi$) and $\sim 500\mu\text{m}$ (rz) @ 4T for right gas if diffusion limited
- 2-track resolution <2mm ($r\phi$) and <5mm (rz)
- dE/dx resolution <5%
- Full precision/efficiency at 30 x estimated backgrounds

R&D program

- gain experience with MPGD-TPCs, compare with wires
- study charge transfer properties, minimize ion feedback
- measure performance with different B fields and gases
- find ways to achieve the desired precision
- investigate Si-readout techniques
- start electronics design for 1-2 million pads
- study design of thin field cage
- study design thin endplate: mechanics, electronics, cooling
- devise methods for robust performance in high backgrounds
- pursue software and simulation developments

OUTLINE

First, briefly,

- ◆ Gas-amplification systems
- ◆ Prototypes
- ◆ Facilities
- ◆ Overview a few activities which are still in early stages
 - Field cage
 - Electronics
 - Mechanics
 - Simulation

Then, PROTOTYPE RESULTS and PLANS...

Gas-Amplification Systems: Wires & MPGDs →

GEM: Two copper foils separated by kapton, multiplication takes place in holes, uses 2 or 3 stages

$P \sim 140 \mu\text{m}$

$D \sim 60 \mu\text{m}$

Micromegas: micromesh sustained by $50 \mu\text{m}$ pillars, multiplication between anode and mesh, one stage

$S1/S2 \sim E_{\text{amplif}} / E_{\text{drift}}$

Gas-Amplification Systems:

Possible manufacturers

GEM: --CERN

--Novogorod (Russia)

--Purdue + 3M (USA)

--other companies interested
in Europe, Japan and USA

Micromegas: --CERN together with
Saclay/Orsay on
techniques for
common manuf. of
anode + pillars

Examples of Prototype TPCs

Carleton, Aachen,
Desy(not shown) for B=0
studies

Desy, Victoria, Saclay
(fit in 2-5T magnets)

Karlsruhe, MPI/Asia,
Aachen built test TPCs
for magnets (not shown),
other groups built small
special-study chambers

Facilities

Desy 5T magnet,
cosmics, laser

Saclay 2T magnet,
cosmics

Cern test-
beam (not
shown)

Kek 1.2T, 4GeV
e- test-beam

Desy 1T, 6GeV e-
test-beam

Magnet

Field Cage Activities

- FC ideas tried in Desy test TPC
- Software calculations at Aachen demonstrate need for double-sided strips, test chamber built.
- St.Petersburg calculations of several FC configurations.
- Need to study Alice FC ideas.

Charge measurement with Time-to-Digit Converter

Main idea: use charge-to-time conversion technique

Readout electronics

ASDQ: Amplifier-Shaper-Discriminator-q(charge measurement),
developed for CDF's Central Outer Tracker

Disc Output Width vs. Charge
QTH=0.5V, 48C Threshold

Work on Electronics

Aleph and Star setups (3 of each) used for prototype work don't take advantage of fast Gem/Mm signals from direct e^- .

Rostock working on TDC idea.

Aachen studying highly integrated conventional approach.

Nikhef developing "Si RO" concepts (next slide)

Electronics Development

Nikhef on CMOS readout techniques, joined by Saclay
~ $50 \times 50 \mu m^2$ CMOS pixel matrix + Micromegas or Gem
~ preamp, discr, thr.daq, 14-bit ctr, time-stamp logic / pixel
~ huge granularity(digital TPC), diffusion limited, sensitive to indiv. clusters for right gas
~ 1st tests with Micromegas + MediPix2 chip
→ more later...

Work on Mechanics

IPN Orsay

Arrangements of detectors on the active area of the end cap (2/2) Trapezoidal shapes assembled in iris shape

Annotations: P_x is the type number of PADS boards or frames

12 sectors (30° each) as super modules are defined

On each, 7 modules are fixed
The sizes of detectors are varying from 180 to 420 mm

By rotation of 15° around the axe, these frames are the same

These arrangement seems to be the best as only 4 different PADS are necessary

Principle for a Super Module equipped with detector 1

Deformation limit acceptability to define
Here is $20 \mu\text{m} / \text{mbar}$ of pressure

Complete wheel with 12 super modules

Simulation

- ◆ Much activity
- ◆ Simulations to understand prototype results
- ◆ Must recheck some issues now, like
 - robustness against backgrounds and
 - TPC design, overall performance
- ◆ Work started in Aachen, Desy, Asia...

PROTOTYPE RESULTS

Presently mapping out parameter space:
demonstration phase

- ◆ Gas studies
 - Drift velocity measurements
 - Ion backdrift
 - Track distortion studies
- ◆ Point resolution
 - Two-track resolution
- ◆ Methods for improving resolution
- ◆ Results from CMOS Pixel readout

Gas studies

Choice of gas crucial

- Correlated to diffusion-limited resolution
- Drift field should not be too high
- Drift velocity should not be too low
- Hydrogen in quencher sensitive to neutron background

Studied, e.g. (many done, more underway):

- "TDR" Ar-CH₄(5%)CO₂(2%)
- P5,P10 Ar-CH₄(5%,10%)
- Isobutane Ar-iC₄H₁₀(5%)
- CF₄ Ar-CF₄(2-10%)
- Helium-based

Simulations will be useful since they have been checked (next slide)

Gas studies

Encouraging cross-checks to Magboltz simulation
Karlsruhe group (earlier by Saclay and others also):

Gas studies: ion backdrift

Should be as small as possible to reduce ion buildup in gas-amplification region and possible ion leaking into drift volume.

Micromegas

Gem

Prototype Results

Ion backdrift optimization

Aachen study for GEMs

Minimal ion backdrift can be achieved with:

- E_{Drift} fixed at 240 V/cm
- U_{GEM1} small influence
- E_{T1} maximal
- U_{GEM2} small influence
- E_{T2} minimal
- U_{GEM3} maximal
- E_{Ind} maximal

U_{GEM1} and U_{GEM2} allow variation of effective gain without changing IB.

$B = 4 \text{ T}$, measured at DESY

- Prediction from parametrisation: IB independent of G_{eff}
- Lower G_{eff} yields lower backdrifting charge Q_{IB} .
- For $G_{\text{eff}} = 1000$: $Q_{\text{IB}} \approx 2.5 Q_{\text{primary}}$
- Still an open question: How much ion backdrift can be tolerated?

--With optimization, rel. ion backdrift ~2.5% indep. of gain

--Even with 10^5 more charge-density than expected, optimization dramatic

Prototype Results

Point resolution, Wires

--Measured by Asia/MPI/Desy teams in MPI wire chamber and KEK magnet at KEK test beam (1-4 GeV hadrons with PID), B=0&1T, TDR gas

--2x6mm² pads, 1mm wire-to-pad gap

--PRF width measured to be = 1.43mm

--Point resolution measured by fitting track to outer 6 rows and comparing track to hit on innermost 7th row. This method is known to overestimate the resolution (better method being implemented—see next slides)

Prototype Results

Point resolution, Micromegas

--Ageing negligible

--Diffusion measurements $\Rightarrow$
 $\sigma_{\text{pt}} < 100\mu\text{m}$ possible

--At moment only achieved
for short drift (intrinsic σ)
for gain~5000 (350V mesh),
noise~1000e

--Analysis continuing...

Prototype Results

Point resolution, Gem

--Two examples of σ_{pt} measured for Gems and $2 \times 6 \text{ mm}^2$ pads.

--In Desy chamber (triple Gem), method of fitting track without one padrow whose hit is compared with track (overestimate of σ_{pt}).

--In Victoria chamber (double Gem), unbiased method used: track fit twice, with and without padrow in question, σ determined for each case; geometric mean of the two σ 's gives the correct result.

--In general (also for Micromegas) the resolution is not as good as simulations expect; we are searching for why (electronics, noise, method).

Prototype Results

Improving point resolution with resistive foil

Carleton work. Charge dispersion via resistive foil improves resolution: for $B=0$

$$\sqrt{\sigma_0^2 + \frac{C_D^2}{N_e} z}$$

/DESY
Tree Meeting

Medipix2+Micromegas: results

- Single-electron sensitivity demonstrated:
Fe55 source, open30s/close, He/20%Isobut.,
threshold=3000e, gain=19K (-470V Mmegas),
-1kV drift
- Measure diffusion const.~ $220\mu\text{m}/\sqrt{\text{cm}}$,
N_cluster~0.52/mm, in reasonable agreement
with simulation
- Future: develop "*TimePixGrid*" prototype by
Nikhef/Saclay/et.al. for TPC application

Two-track resolution studies

Laser optics

Studies just starting.

Victoria steering mechanics, Desy laser and 5T magnet.

σ_{point} for cosmics $\sim$ laser $\sim 80\mu\text{m}$
 2-track resol. for lasers $\sim 1\text{-}2\text{mm}$:
 how the resolution on one track is
 affected by presence of a nearby
 parallel track at same drift dist.

Operational experience

- ◆ No systematic statistics yet
- ◆ Several groups have had problems with sparking (with both Gems and Micromegas)
- ◆ But it is too early to take this seriously (I had similar problems with Aleph)
- ◆ Needs systematic study (to avoid an msgc-type problem)...

Other activities:

MIT

Lorentz-angle meas., Gas studies,
Gem resolution/manufacturing

Cornell

Simulation of pad size, resolution
needed

Purdue

Gem manufacture together with
3M company

Cornell/
Purdue

Manufacture of prototype for studies

General Happenings...

- ◆ **Steering group** takes care of workshop/conference talks, phone/video meetings, contact with other labs, etc.
- ◆ **Video, VRVS/phone TPC R&D meetings** every few months
- ◆ **Task-sharing** among groups is very fruitful and productive, e.g.
 - LBNL providing Star electronics for Canadian, French, German labs
 - MPI providing Aleph electronics for Asian, Canadian, German labs
 - DESY 5T magnet to be used by Canadian and German groups
 - Saclay 2T magnet to be used by North American and French groups
 - Test beams in DESY and KEK being used by Asian, Canadian, German labs
 - MicroMEGAS work by Canadian, French and US groups
 - GEM projects by Canadian, German, Russian and US groups
 - Fieldcage studies started in Russia and Germany
 - Electronics work in Canada, Germany, Holland, France
 - Endplate mechanics/cooling studied by German, French groups

Plans

◆ 1) Demonstration phase

- Continue work for ~1 year with small prototypes on mapping out parameter space, understanding resolution, etc, to prove feasibility of an MPGD TPC. For Si-based ideas this will include a basic proof-of-principle.

◆ 2) Consolidation phase

- Build and operate "large" prototype ($\varnothing \geq 70\text{cm}$, drift $\geq 50\text{cm}$) which allows any MPGD technology, to test manufacturing techniques for MPGD endplates, fieldcage and electronics. Design work would start in ~1/2 year, building and testing another ~ 2 years.

◆ 3) Design phase

- After phase 2, the decision as to which endplate technology to use for the LC TPC would be taken and final design started.

Summary

- Experience with MSGCs being gathered rapidly
- Gas properties rather well understood
- Diffusion-limited resolution seems feasible
- Resistive foil charge-spreading demonstrated
- CMOS RO demonstrated
- Design work starting

Requests

- Continued support of PRC
- Positive recommendations to funding agencies
- PRC support for globalization of R&D
- Test beam facilities for next 3 years

TPC milestones

2005	Continue testing, design large prototype
2006-2007	Test large prototype, decide technology
2008	Proposal of/final design of LC TPC
2012	Four years for construction
2013	Commission TPC alone
2014	Install/integrate in detector
