

Eigenmode Calculation for the BC0 Vacuum Chamber

TECHNISCHE
UNIVERSITÄT
DARMSTADT

W. Ackermann, W.F.O. Müller, T. Weiland

Institut für Theorie Elektromagnetischer Felder, Technische Universität Darmstadt

Status Meeting
December 19, 2013
TEMF, TU Darmstadt

Computational Model

- Bunch compressor 0
 - Vacuum chamber (construction)

Computational Model

- Bunch compressor 0
 - Vacuum chamber (electric model)

▪ Bunch compressor 0

- Particle trajectories

- Hard-edged magnets: analytical calculation of particle trajectories
- Determination of local coordinates aligned to tangential direction
- Specification of sample points to evaluate eigenmode fields

- Eigenvalue solver and auxiliary programs
 - Postprocessing
 - Change point evaluation from existing 'line' to new 'arbitrary list'
 - Specify list of points along selected trajectory
 - Evaluate field components for all determined modes and all points
 - Transform field components to the particles coordinate system
 - Perform path integration to determine shunt impedance

Simulation Results

- Eigenvalue solver
- Computational mesh

Simulation Results

- Eigenvalue solver
 - Field pattern of the electric field strength

Simulation Results

- Eigenvalue solver
 - Field pattern of the electric field strength

... more than 1000 modes have been examined (all modes up to 4 GHz).

Simulation Results

- Eigenvalue solver
 - Field pattern of the electric field strength

- Components of the electromagnetic 'force' $\vec{F} = \vec{E} + \vec{v} \times \vec{B}$

Simulation Results

- Eigenvalue solver

- Field pattern of the electric field strength

- Components of the electromagnetic 'force' $\vec{F} = \vec{E} + \vec{v} \times \vec{B}$

Simulation Results

- Eigenvalue solver
 - Field pattern of the electric field strength

- Components of the electromagnetic 'force' $\vec{F} = \vec{E} + \vec{v} \times \vec{B}$

Simulation Results

- Eigenvalue solver

- Field pattern of the electric field strength

- Components of the electromagnetic 'force' $\vec{F} = \vec{E} + \vec{v} \times \vec{B}$

Simulation Results

- Eigenvalue solver
 - Field pattern of the electric field strength

- Components of the electromagnetic 'force' $\vec{F} = \vec{E} + \vec{v} \times \vec{B}$

Simulation Results

- Eigenvalue solver

- Field pattern of the electric field strength

- Components of the electromagnetic 'force' $\vec{F} = \vec{E} + \vec{v} \times \vec{B}$

▪ Summary:

- Computational model for BC0 available from DESY
- Trajectories used for field evaluation can be determined analytically due to hard-edge magnet approximation (applicable to extract points and local coordinate systems)
- Field pattern for various modes have been determined with the help of real-valued eigenanalysis
- Postprocessing of all modes (>1000) up to 4 GHz did not identify any harmful modes for the selected trajectories
