

Welcome to DESY.

What is DESY and what kind of research is done here?

Michael Grefe
DESY Press and Public Relations (PR)

What is DESY?

> **Deutsches Elektronen-Synchrotron**
(German electron synchrotron) DESY

> A national research centre of the

> Established: 18 December 1959 in Hamburg

> Two locations: Hamburg and Zeuthen

> Annual budget: 192 million euros

- 90% Federal Ministry of Education and Research
- 10% city of Hamburg and federal state of Brandenburg

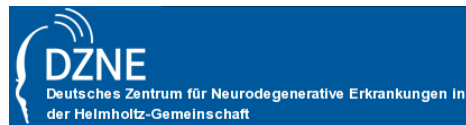

Helmholtz association of german research centres

> Germany's largest scientific organisation

- 16 research centres
- 30 000 employees
- 3 billion euros annual budget

> *Fundamental research* to solve major challenges facing society, science and industry

> Pursuit of long-term research objectives of the state

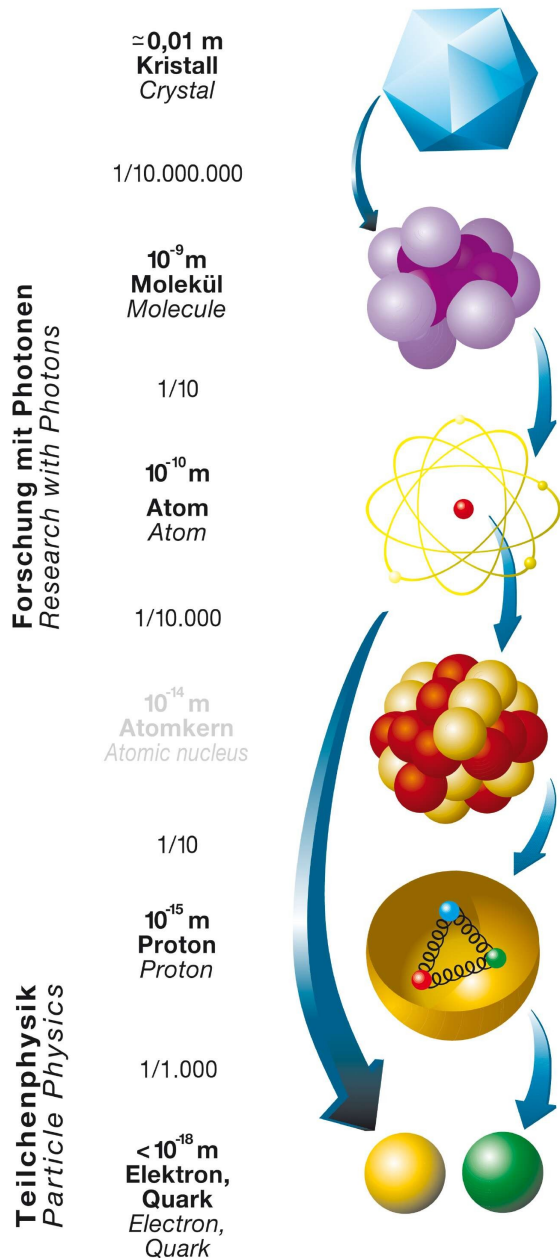

Who works at DESY?

- Approximately 2000 employees
 - Including some 650 scientists
- Training programmes
 - More than 100 young people are being trained in commercial and technical vocations
- Young scientists
 - Around 700 graduate students, PhD students and postdocs
- Guest researchers
 - More than 3000 from 40 countries annually

What kind of research is done at DESY?

> We do fundamental research in natural sciences

> Research with photons

- Investigation of molecular and atomic structures from all natural sciences using a special kind of light originating from particle accelerators

> Accelerators

- Development, construction and operation of particle accelerators
- Common basis for particle physics and research with photons

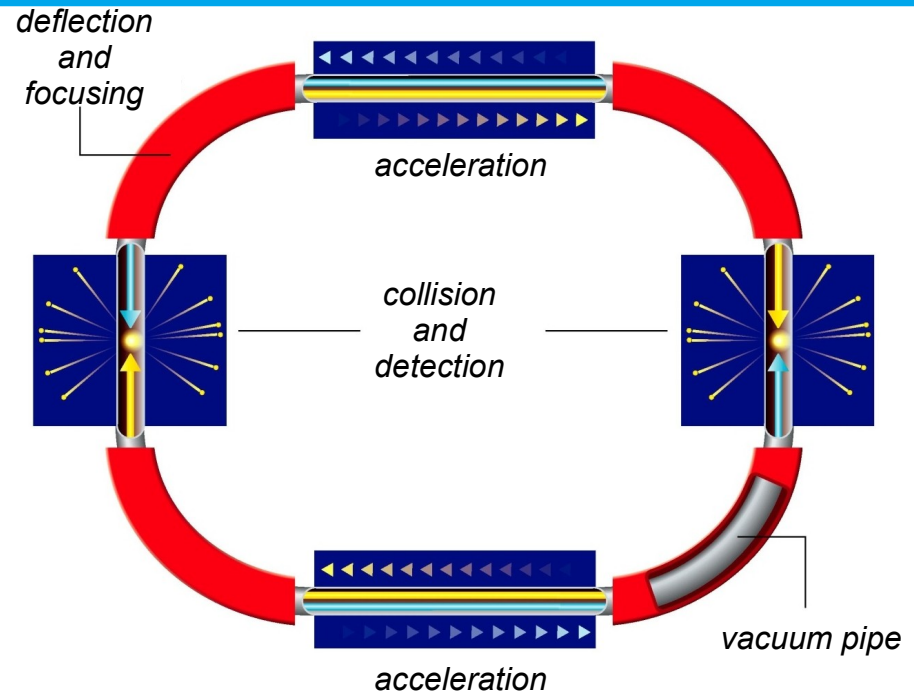

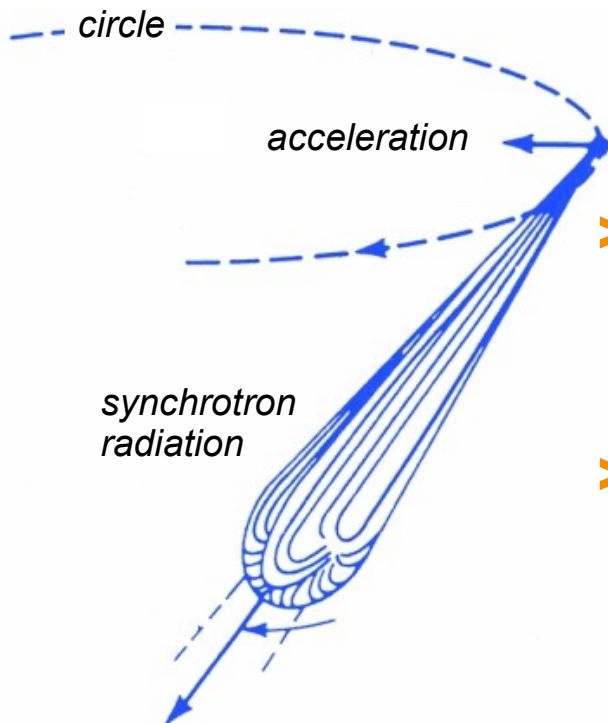

> Particle physics

- Investigation of the fundamental building blocks and forces that make up our universe

What is a particle accelerator/collider?

> Charged particles (electrons, protons, ...)

- Are accelerated using electric fields
- Are deflected using magnetic fields

> What limits the achievable energy?

- The magnetic field strength cannot be increased arbitrarily
- Energy loss due to synchrotron radiation in the curves

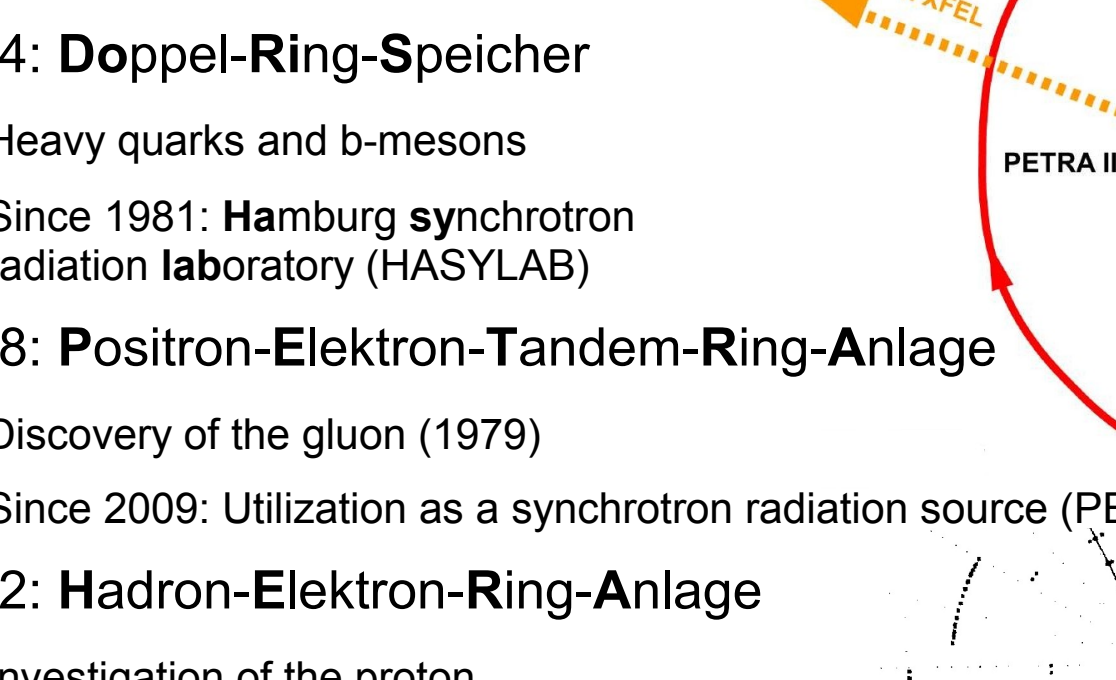

> Solutions:

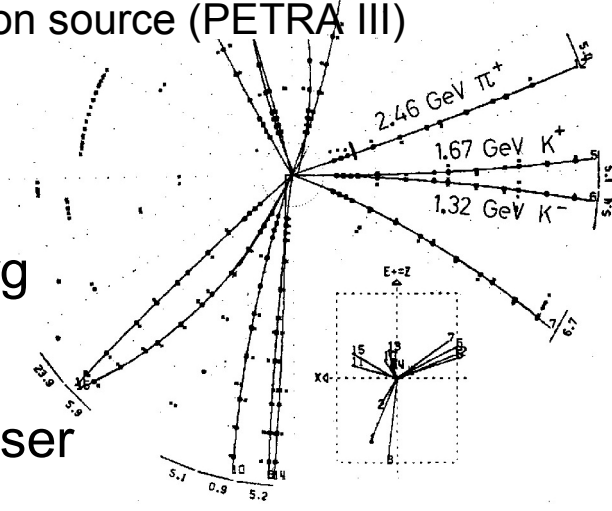

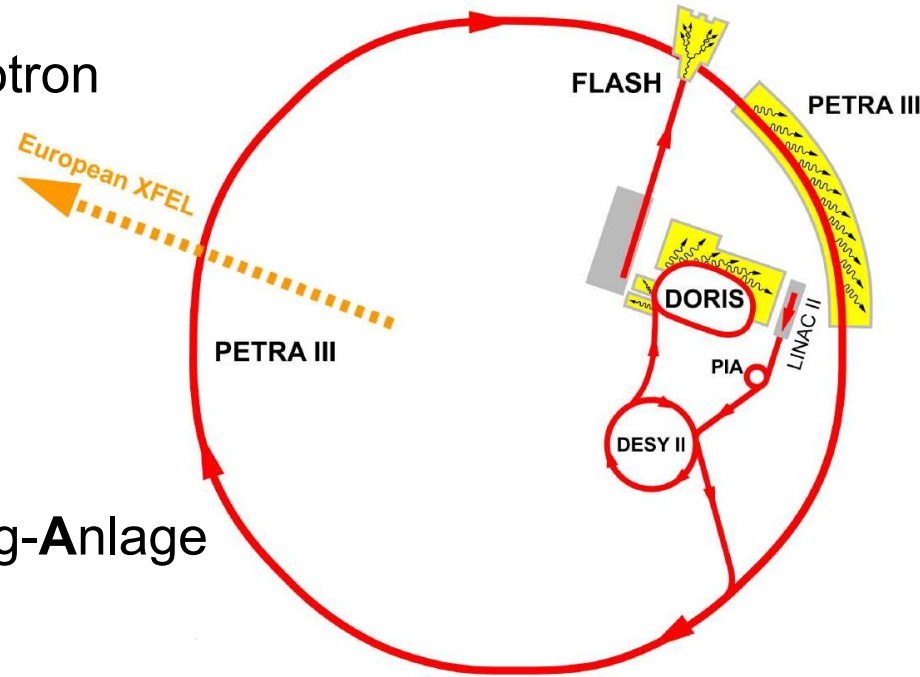

- Storage rings with a larger circumference
- Accelerators without curves → linear colliders

Which accelerators are there at DESY?

The history of accelerators at DESY

- > 1964: **Deutsches Elektronen-Synchrotron**
 - Confirmation of quantum electrodynamics
 - > 1974: **Doppel-Ring-Speicher**
 - Heavy quarks and b-mesons
 - Since 1981: **Hamburg synchrotron radiation laboratory (HASYLAB)**
 - > 1978: **Positron-Elektron-Tandem-Ring-Anlage**
 - Discovery of the gluon (1979)
 - Since 2009: Utilization as a synchrotron radiation source (PETRA III)
 - > 1992: **Hadron-Elektron-Ring-Anlage**
 - Investigation of the proton
 - > 2005: **Freie-Elektronen-Laser in Hamburg**
 - First FEL in the soft X-ray range
 - > 2014: **European X-Ray Free-Electron-Laser**
 - Most intensive X-ray Laser in the world

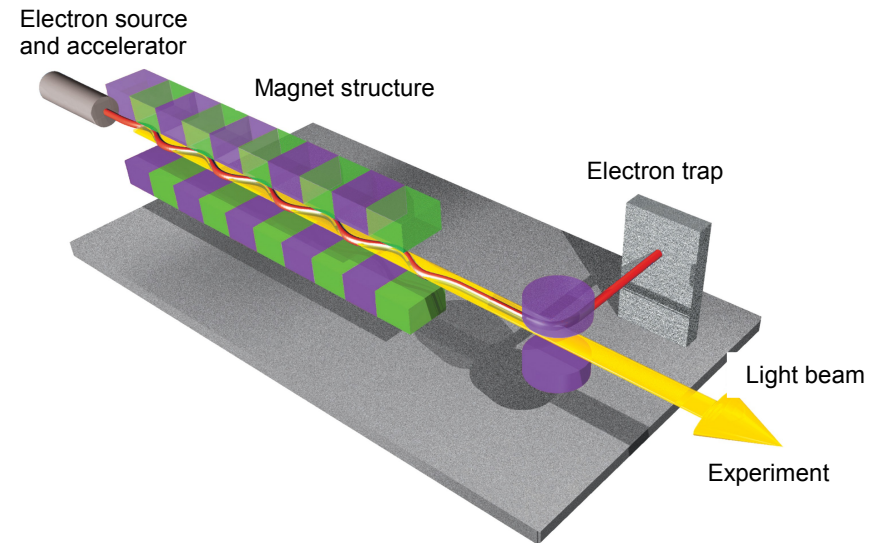

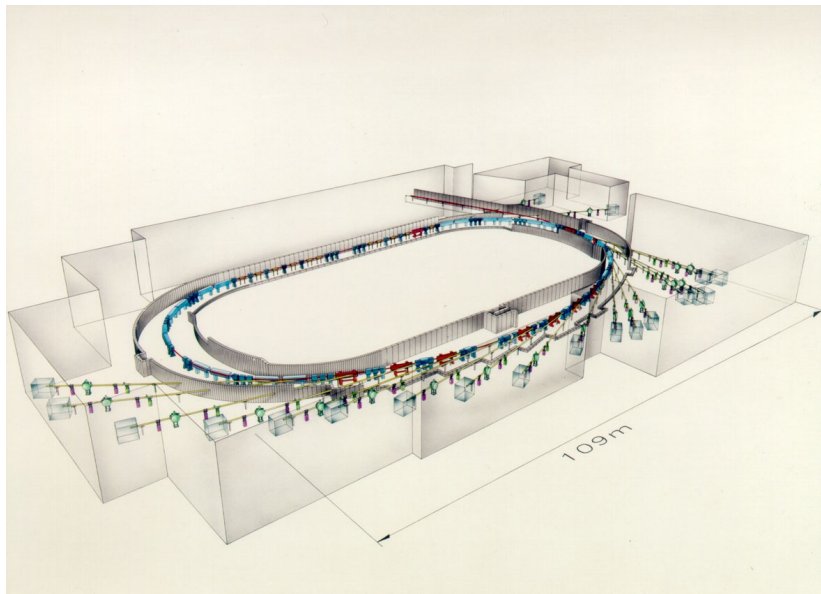

Research with photons

> Synchrotron radiation is light with special characteristics

- Very intensive
- Very strongly focused
- Very broad spectrum (wavelength can be chosen according to the needs of the experiment)

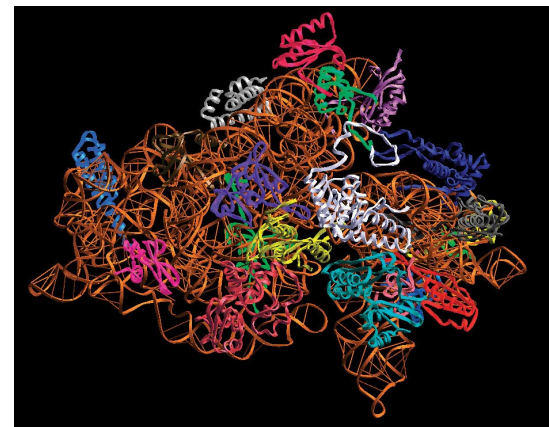

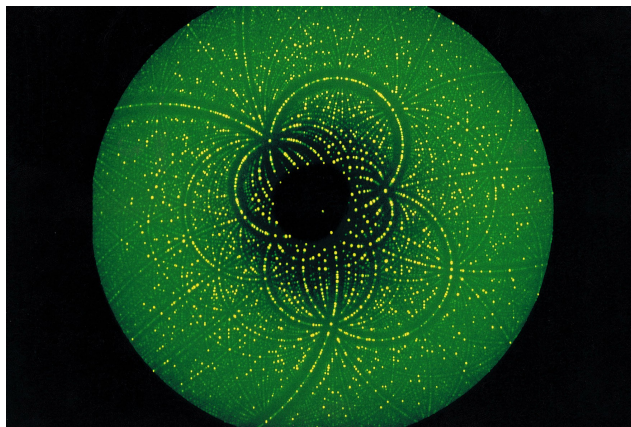

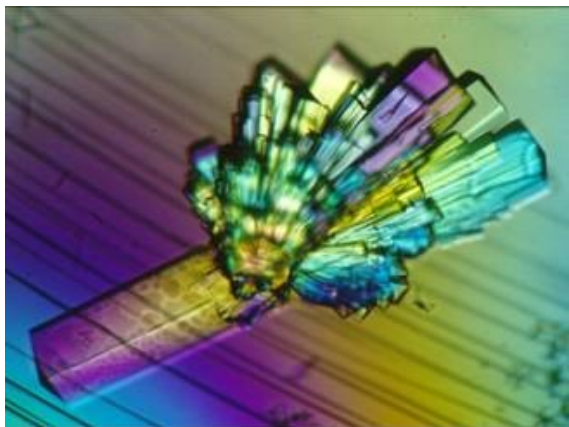

> Particle accelerators are used as synchrotron radiation sources

- Storage rings: DORIS III (HASYLAB) and PETRA III
- Free-electron lasers: FLASH and the European XFEL

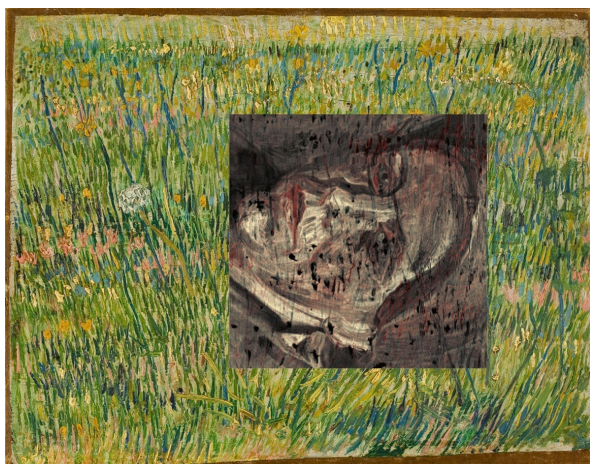

Applications of synchrotron radiation

> Structural analysis, e.g. of biomolecules

■ From protein crystals ... via diffraction images ... to the 3D structure of ribosomes

> Structure of ribosomes: Nobel Prize in Chemistry 2009 (*Ada Yonath*)

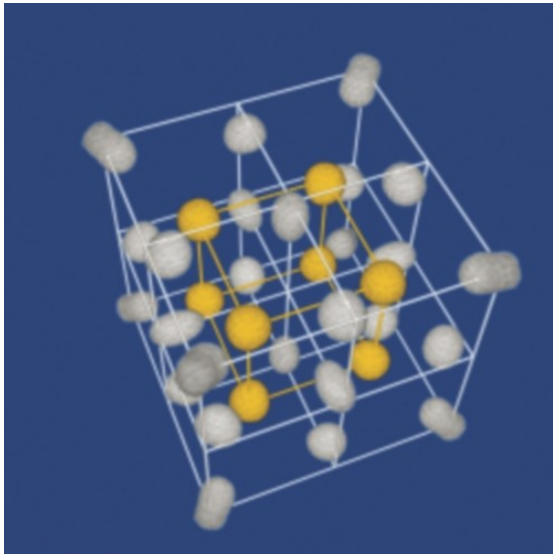

- > Material science
- > Investigation of plasmas
- > Reconstruction of a hidden portrait in Van Gogh's painting *Grasgrond*

PETRA III & FEL: The capabilities of our facilities

> PETRA III

- Incoherent light beam can only probe materials with a crystalline structure

- Crystals

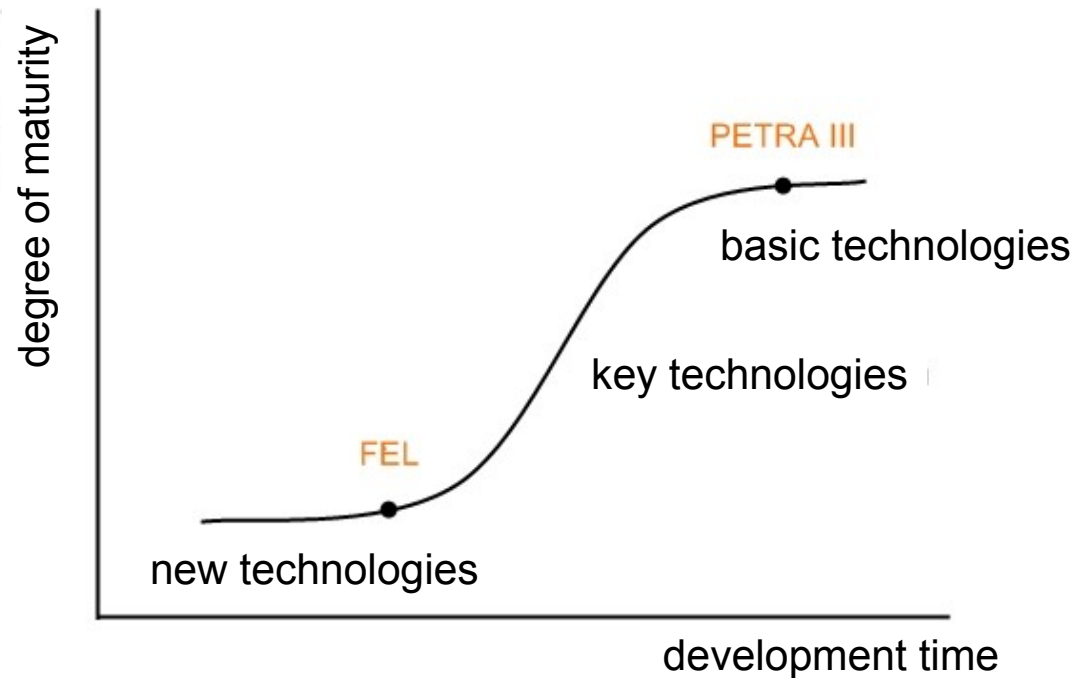

> Free-electron laser

- Coherent light beam can also probe materials with an irregular structure

- Noncrystalline solids
- Biological substances

Light sources at DESY: Today, tomorrow and beyond

> PETRA III – Best light source using today's technology

- Mature technology
- High application potential:
Use for industry, medical sciences, ...
- Freeze images of the nanocosm

> Free-electron laser – Technology of tomorrow

- Revolutionary technology
- Live observations of the nanocosm

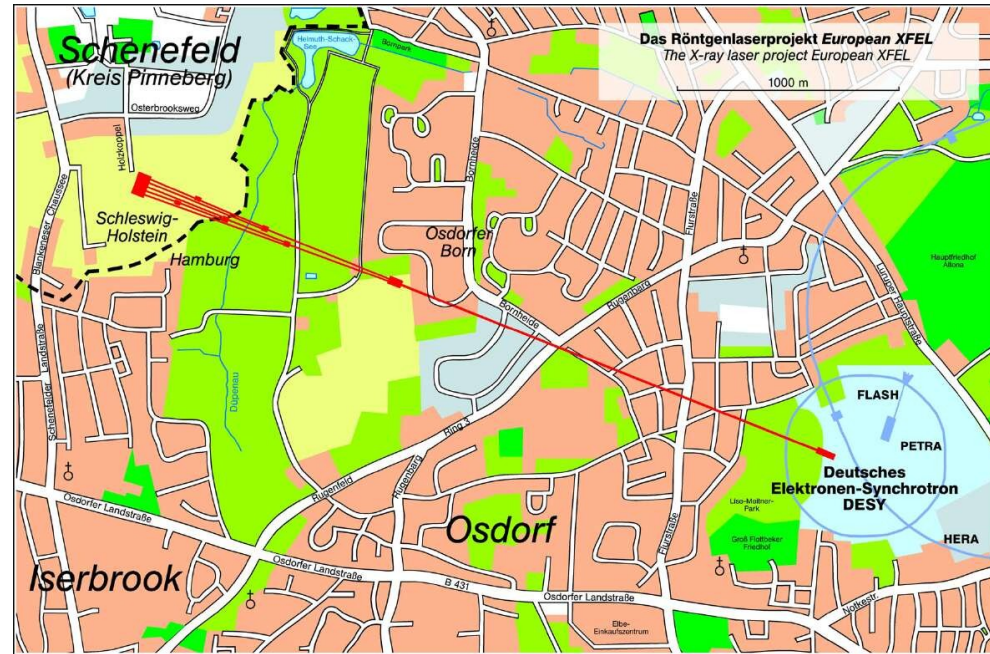

The future: European X-ray Free-Electron Laser (XFEL)

> Revolutionary light source for fundamental research with ultra-short X-ray flashes

- Length: 3,4 km
- Completion: 2014

> Applications:

- Observation of single molecules
- Filming of chemical reactions

> Acceleration technology developed at DESY

- Successfully tested at the prototype FLASH

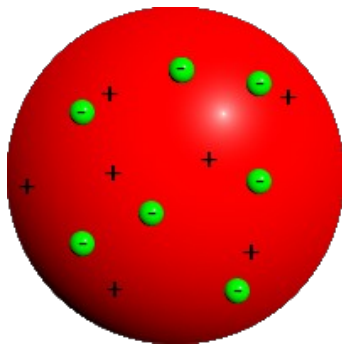

The beginnings of particle physics

- Around 400 BCE – „By convention sweet, by convention bitter, by convention hot, by convention cold, by convention color: but in reality atoms and void.“ (*Democritus*)

- 19th century – Periodic table of the elements (*Mendelejew, Meyer*)

- 1897 – Discovery of the electron (*Thomson*)
- 1903 – Thomson atomic model (Plum pudding model)

Periodic Table of the Elements

1	2											13	14	15	16	17	18	
1 H Wasserstoff 1.01																	2 He Helium 4.00

The beginnings of particle physics

> 1909 – Rutherford experiment

- Scattering of alpha particles off a gold foil
- In contrast to the expectations based on the plum pudding model a small fraction of the particles is deflected by a large angle or even reflected

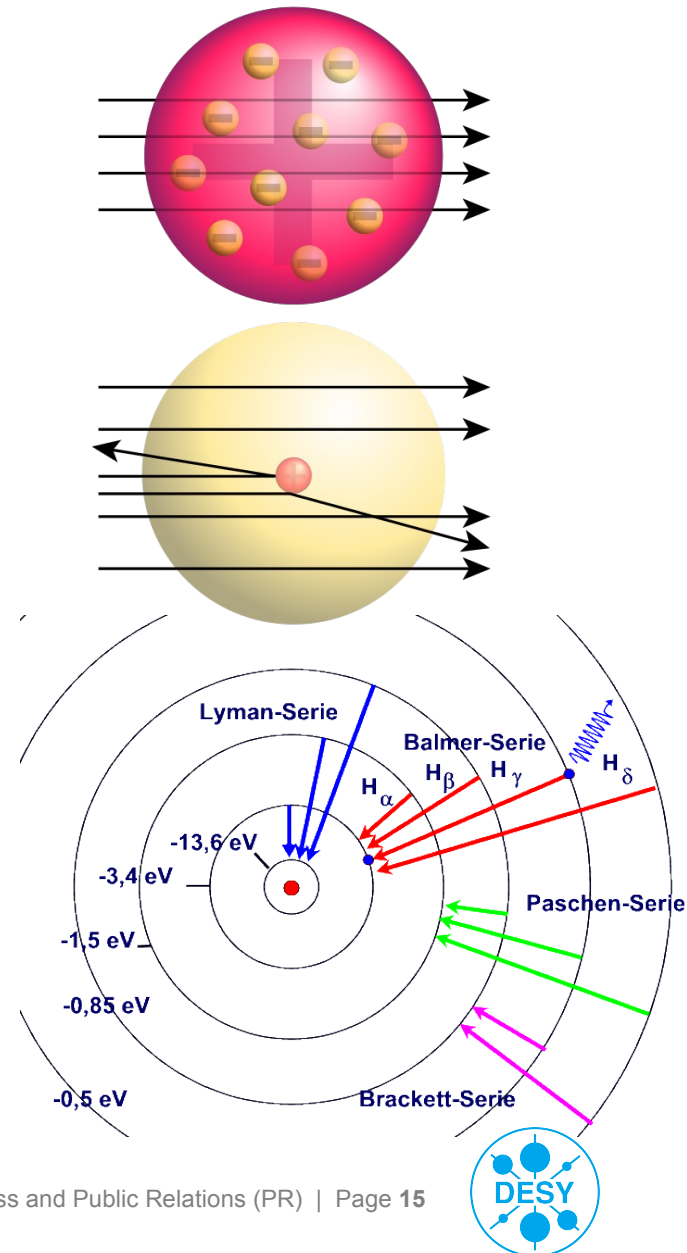

> 1911 – Rutherford model

- The mass and the positive charge of the atoms is concentrated in a tiny, compact nucleus

> 1913 – Bohr model

- The electrons move on *quantised* circular orbits around the nucleus
- This model explains the atomic spectral lines

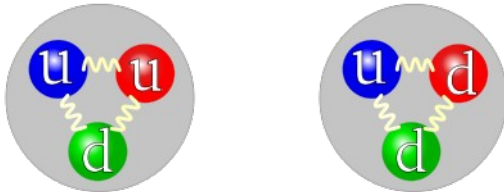

> Around 1950 until today – Discovery of new elementary particles at particle accelerators

The standard model of particle physics

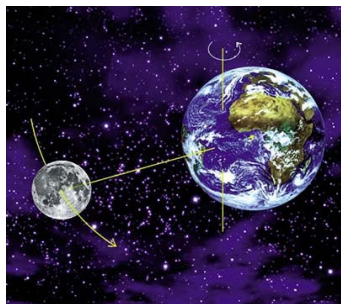

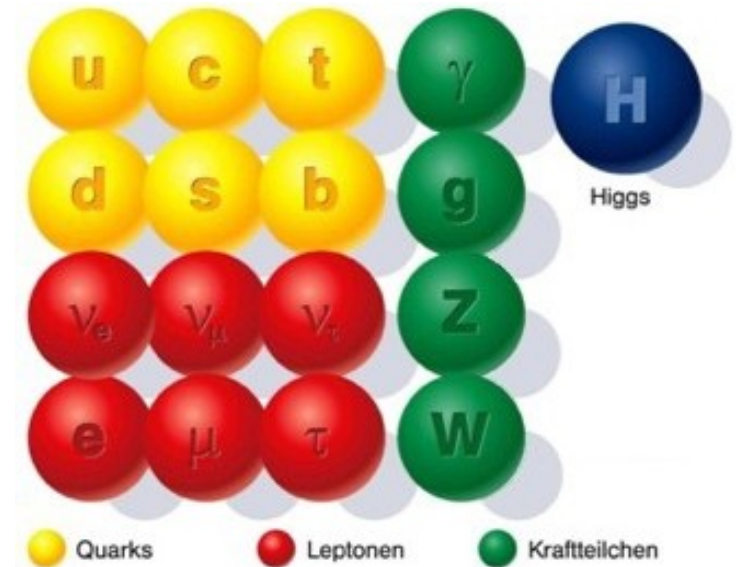

> All matter consists of point-like, indivisible elementary particles

- Protons and neutrons consist of quarks

- Quarks: up up down up down down
- Charge: $+\frac{2}{3} + \frac{2}{3} - \frac{1}{3} = +1$ $+\frac{2}{3} - \frac{1}{3} - \frac{1}{3} = 0$

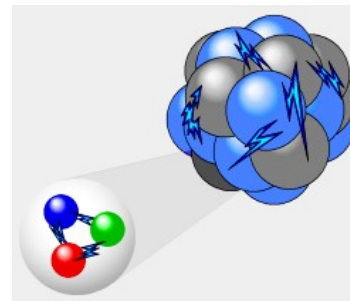

> Forces between matter particles are mediated by the exchange of other particles

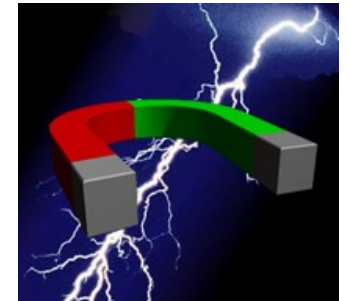

- Gravity
(Graviton?)

- Weak force
(W and Z bosons)

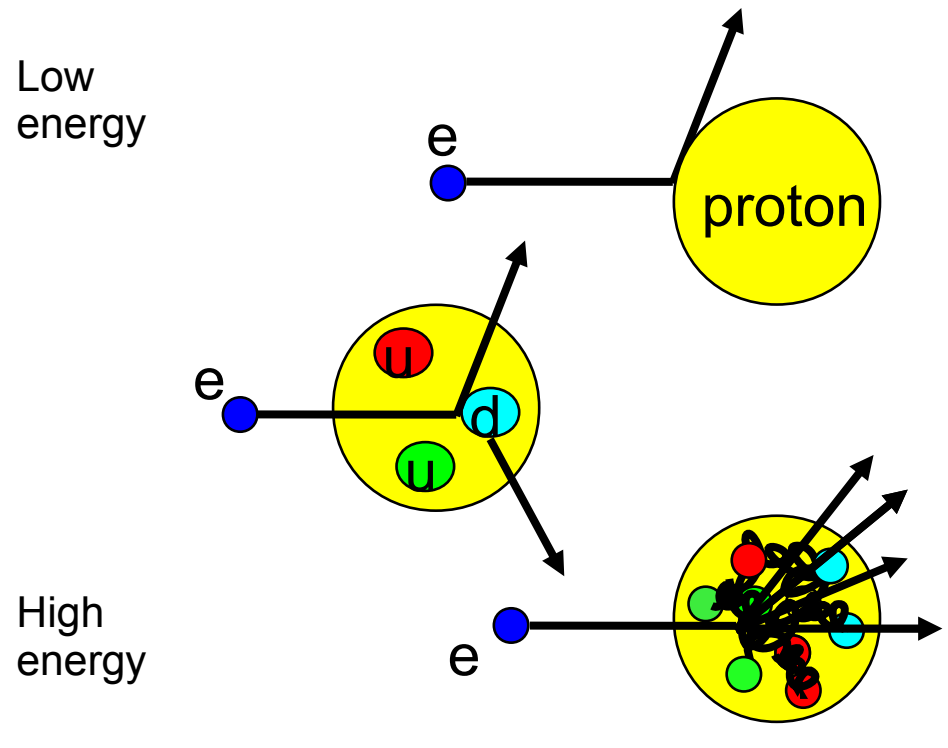

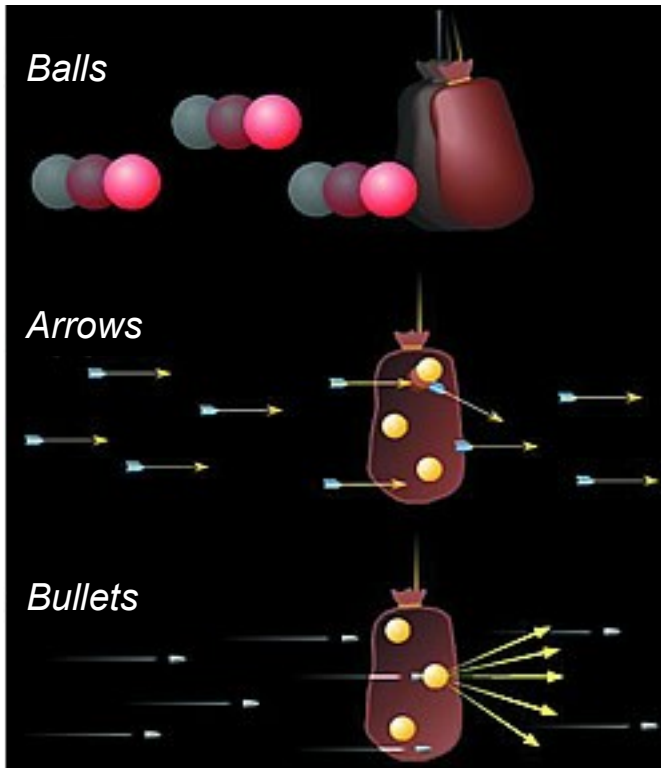

- Strong force
(Gluons)
discovered at DESY

- Electromagnetism
(Photon)

How do we know all this?

- Investigation of the structure of known particles in scattering experiments
 - High energy = High resolution

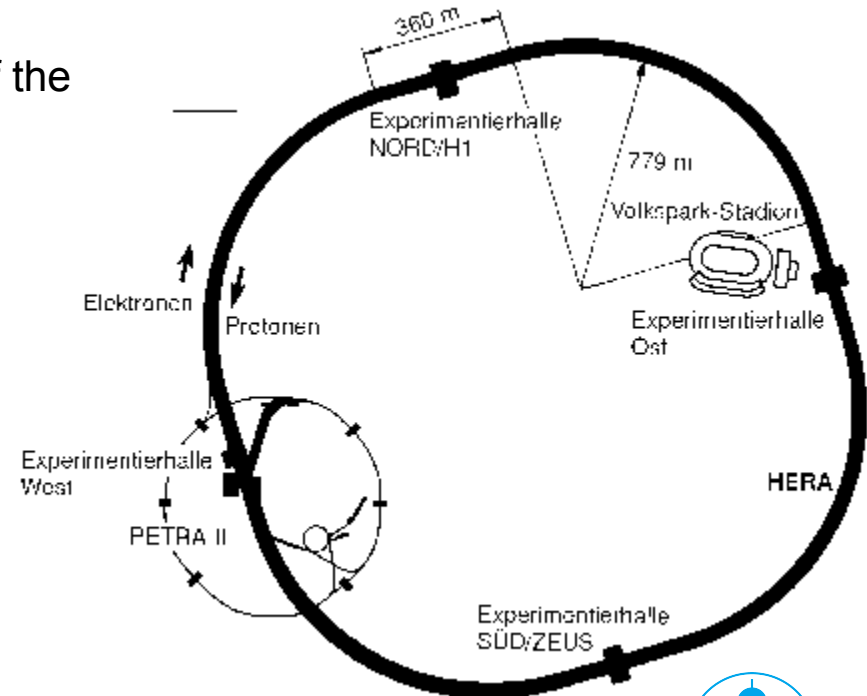

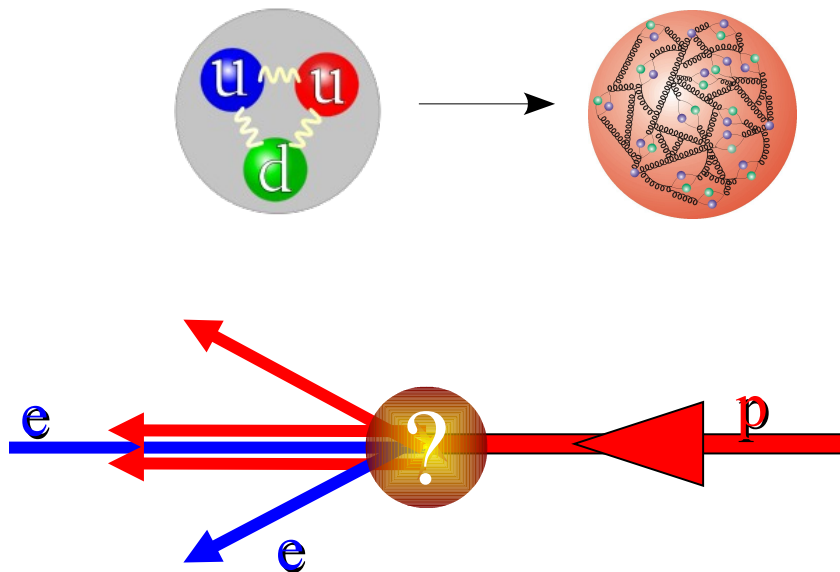

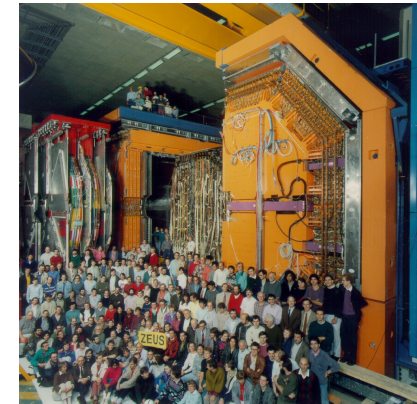

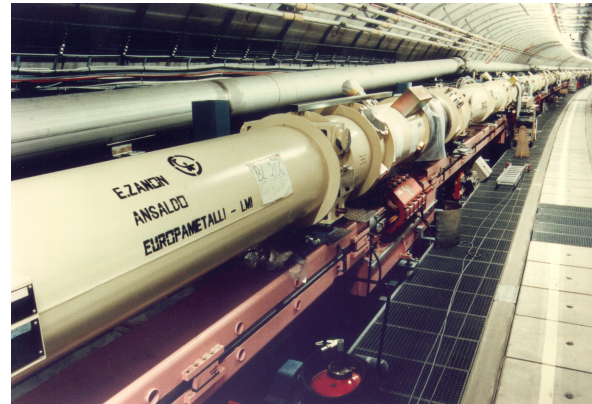

- Creation of new, heavy particles according to $E=mc^2$
 - Light, known particles with a large kinetic energy → new, heavier particles

Hadron-Elektron-Ring-Anlage (HERA)

> Electron-proton storage ring

- Start of construction: 1984
- Circumference: 6,3 km
- Running period: 1992 – 2007
- Data analysis until 2014
- Unique particle accelerator of this kind
- Essential contribution to the investigation of the proton structure

Large Hadron Collider (LHC)

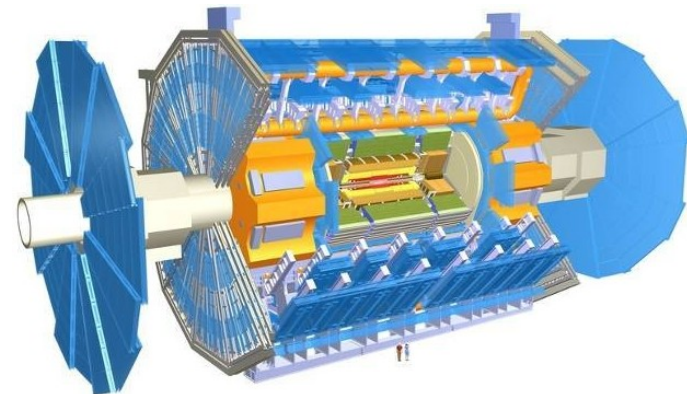

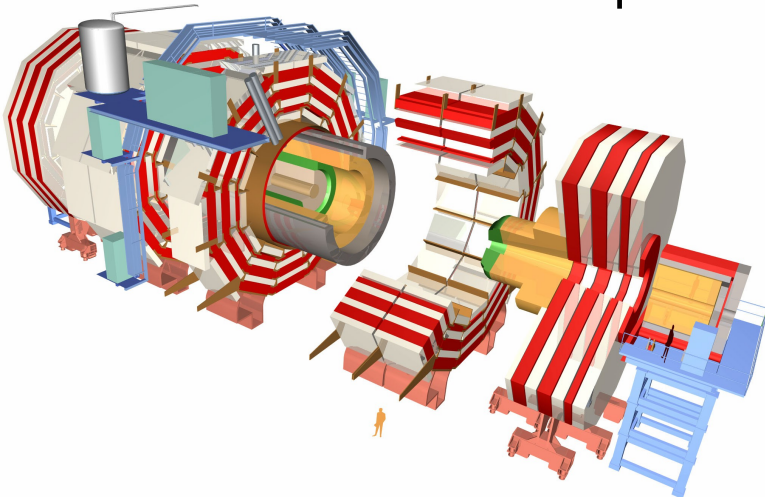

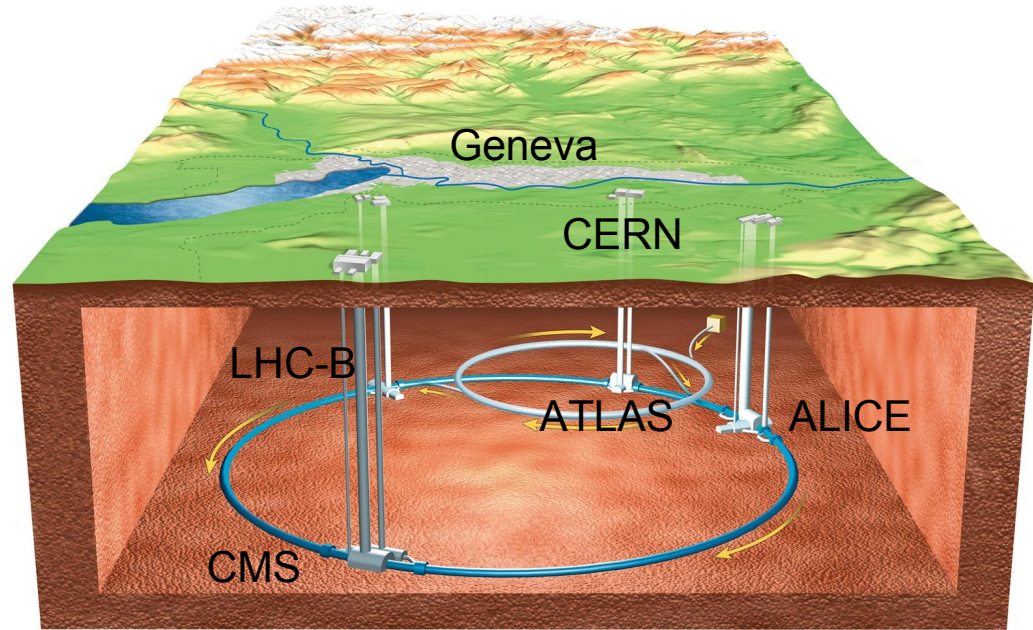

> Proton-proton storage ring

- Location: CERN close to Geneva
- Circumference: 27 km
- Highest energetic accelerator in the world
- Start of the measurements: 2009

> Objectives:

- Discovery of the Higgs particle
- Discovery of additional new particles beyond the standard model of particle physics

> DESY is involved in the particle detectors CMS and ATLAS

The Future: International Linear Collider (ILC)

> Electron-positron linear accelerator

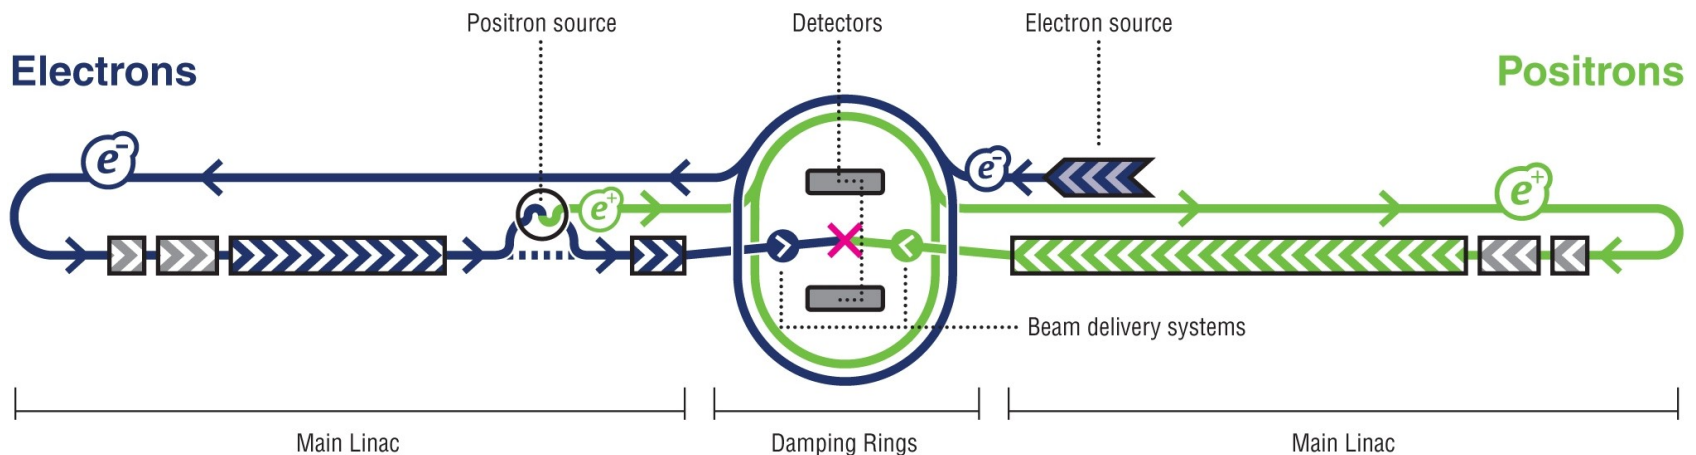

- In planning stage, decision on construction and location by 2012
- Length: More than 30 km

> Objectives:

- Precision measurements of the new physics discovered at the LHC

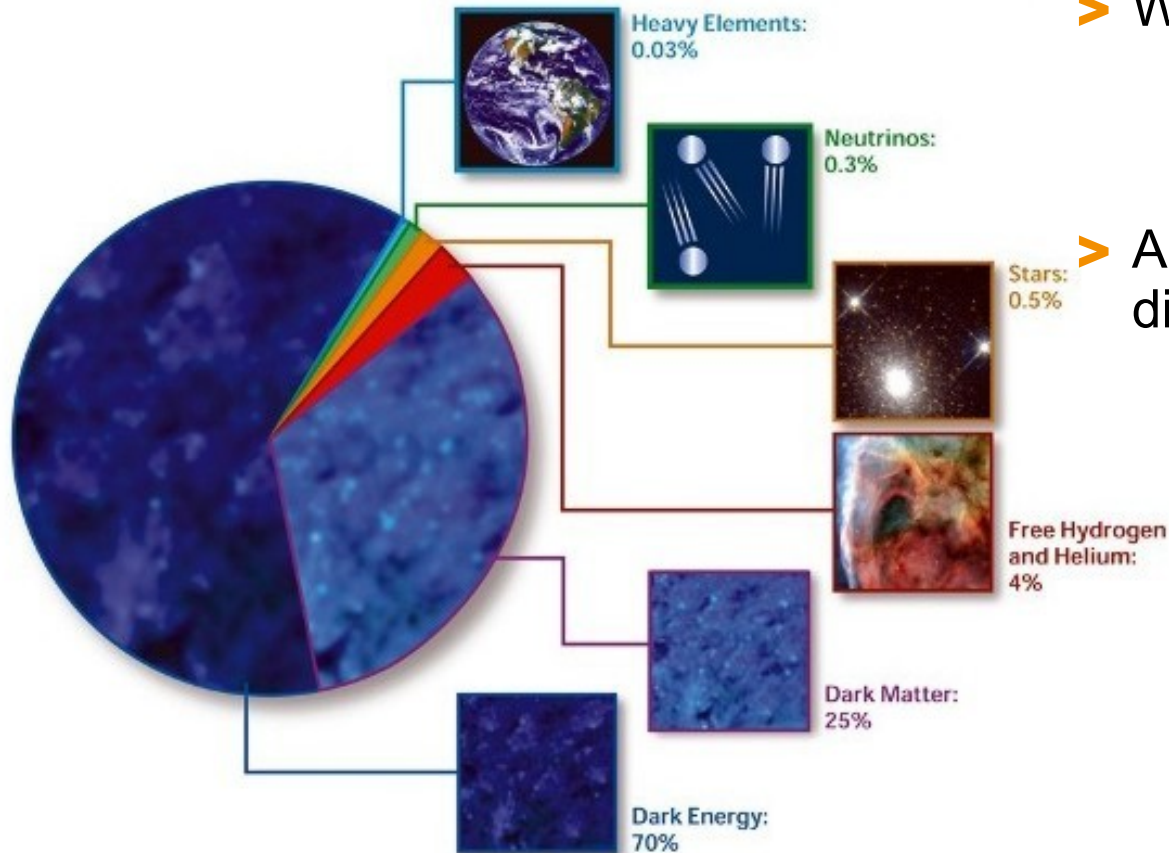

> Acceleration technology developed at DESY (FLASH, European XFEL)

> DESY is also involved in the development of the particle detectors

Further Open Questions ...

- What is the origin and the fate of the universe?
 - Why is the universe made of matter and not of antimatter?
 - What is the dark energy?

- What is the dark matter?
 - A new elementary particle?
 - Or several?
- Are there additional dimensions of space-time?
 - String theory?

Have fun at the guided tour!
