

# ZEUS Status Report

---

**Andrea Parenti (DESY)**

**on behalf of  
the ZEUS Collaboration**

- General remarks
- Physics Highlights
- Conclusions

Andrea Parenti

69. PRC – Open session

# Physics Activities

---

- 44 ongoing analyses:
  - 8 high- $Q^2$ , 4 SF, 10 QCD, 19 HFL, 3 Diffr.
- 12 more papers expected this year...
- ... but some high profile analyses delayed
  - High- $Q^2$   $e^+p$  NC DIS (due to rate/lumi issues)
  - Leptoquarks (manpower)
- Fully committed to the combination effort, but suffering from manpower shortages

# New papers since last PRC

---

- Measurement of beauty production in DIS and  $F_2^b$  extraction at ZEUS (DESY-10-047)
- Inclusive-jet cross sections in NC DIS at HERA and a comparison of the  $k_T$ , anti- $k_T$  and SIScone jet algorithms (DESY-10-034)
- Scaled Momentum Spectra in deep inelastic Scattering at HERA (DESY-09-229)
- Measurement of  $D^+$  and  $\Lambda_c$  production in DIS at HERA (at directorate)
- Measurement of high- $Q^2$  charged current deep inelastic scattering cross sections with a longitudinally polarised positron beam at HERA (after reading)
- Inclusive dijet cross sections in neutral current deep inelastic scattering at HERA (after reading)

# New preliminary results since last PRC

---

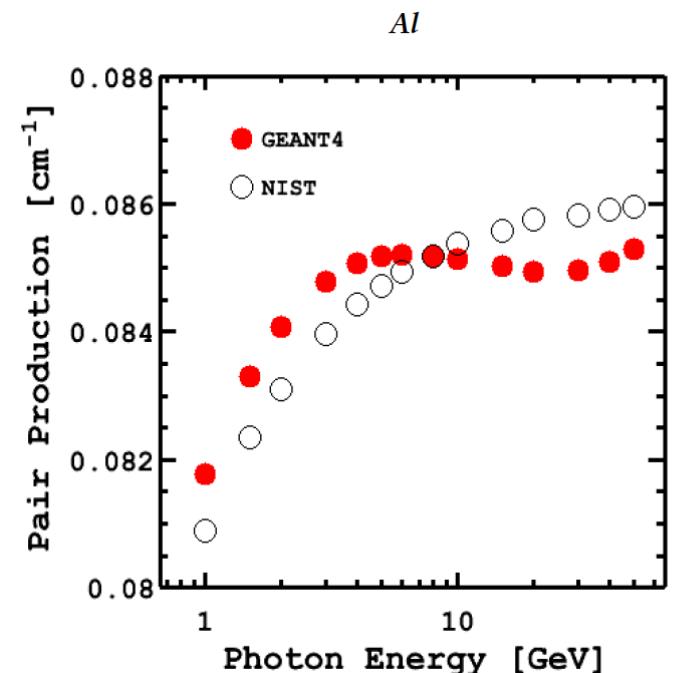

- Neutral current cross section at high  $x$
- HER-MER-LER cross sections at high  $y$  and low  $Q^2$
- H1+ZEUS: combined HER-MER-LER cross sections and  $F_L$
- H1+ZEUS: QCD fits including HER-MER-LER data
- H1+ZEUS: QCD fits including charm data
- Inclusive jets in NC DIS
- Inclusive jets in PHP
- $D^+$  in DIS and  $F_2^c$
- Beauty in DIS from inclusive secondary vertices

# Progress on Luminosity

- theory  
0.5%
- aperture and detector alignment  
1%
- conversion in window  
2%
- rate  
0.6%
- X-position  
1.1%
- all other systematics checked  
negligible (< 0.5%)

2.6 %

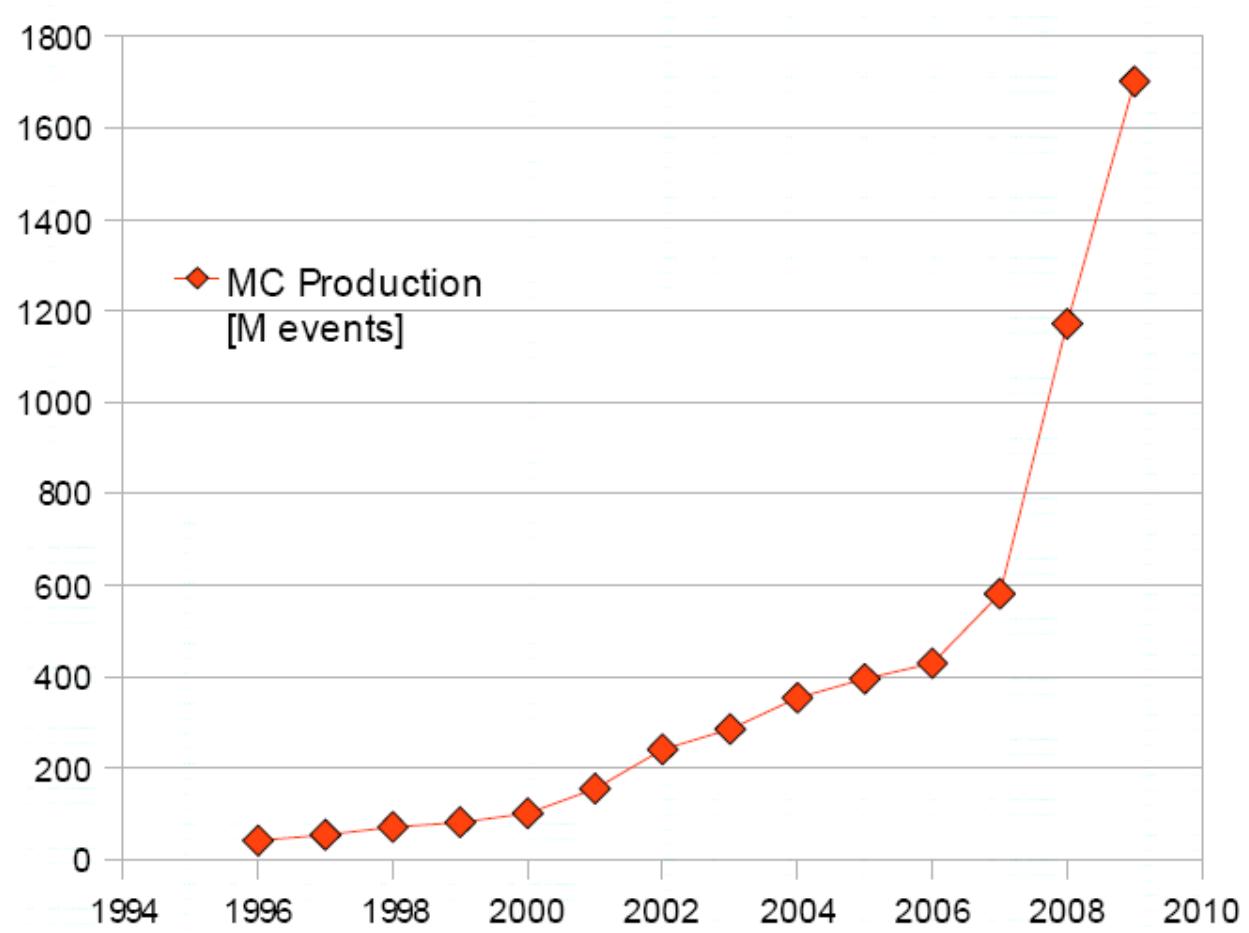

- Why? E.g. one dominant uncertainty in  $\alpha_s$  measurement
- Theory error much better understood
  - full new  $\alpha_{em}^3$  calculation of Bethe-Heitler by V. Makarenko (to be publ.)
- window conversion: 2% → 0.7%
- Total error: 2.6% → 1.8%

# Monte Carlo simulations

---

- Monte Carlo simulations are essential for data analysis.
- Last year we produced > 1.7 billion events!
- We will need a similar production also in 2010.

# Data preservation

---

- settled on the model (see paper to PRC)
  - common ntuple format
  - virtualized MC and analysis software
  - MC generation on the grid
- dedicated ZEUS computing support ends 12/2011
- Data custody goes to IT
- Governance to be defined
- Schedule is aggressive!
- Work is needed:
  - What resources will be available?

# ZEUS Management

---

- Physics Coordinators
  - M. Turcato (HH) , E. Tassi (Cosenza) → A. Geiser (DESY), B. Reisert (MPI)
- Spokesperson
  - T. Haas (DESY) → A. Levy (Tel Aviv)
- Collaboration structure after 2011 still under discussion

# ZEUS(+combined) talks at DIS 2010

---

## Inclusive:

High- $Q^2$  CC  
NC at high- $x$   
NC/CC and PDF fits  
Combined  $F_L$

QCD fits with low energy data  
QCD fits with charm data

## HFL:

Incl. beauty in DIS  
Incl. beauty in PHP  
Charm mesons in DIS  
Inelastic J/ $\psi$  helicity

## QCD:

Jets with anti- $k_T$  and SIScone, (di)jets  
in NC DIS  
Three subjets  
Jets in PHP  
Scaled momenta  
Prompt photon

## Diffraction:

Diffractive PDFs  
J/ $\psi$  at high  $t$

## EW/searches:

Isolated leptons  
Multi-leptons  
LQ and CI

Apologies for not being able to cover all the topics due to time

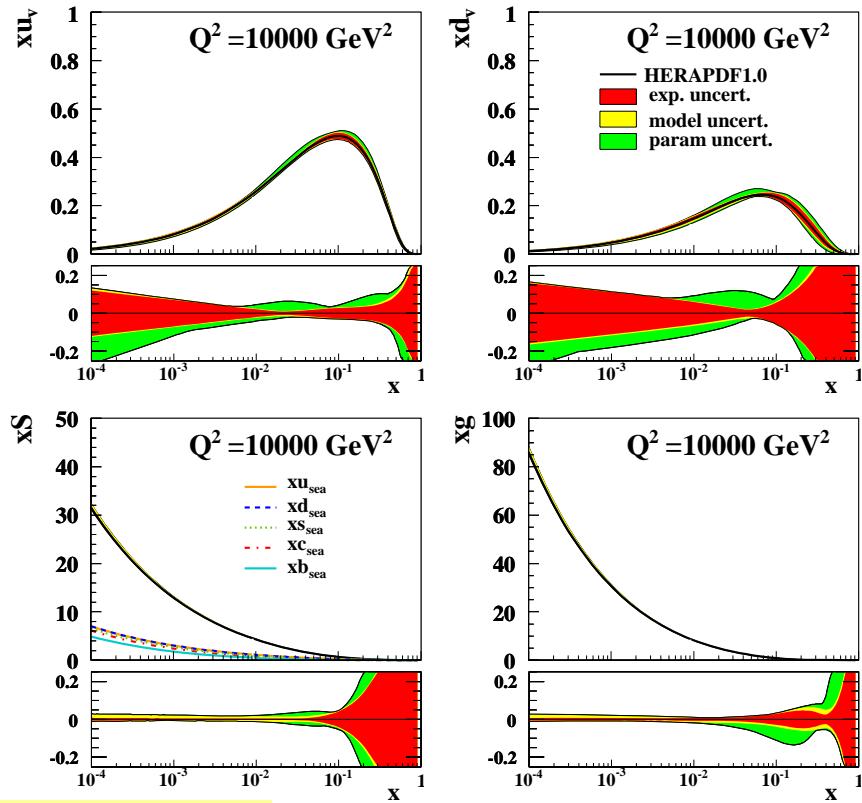

# HERAPDF1.0

The combined NC and CC HERA data have been used as the sole input for the extraction of the HERAPDF1.0.

H1 and ZEUS

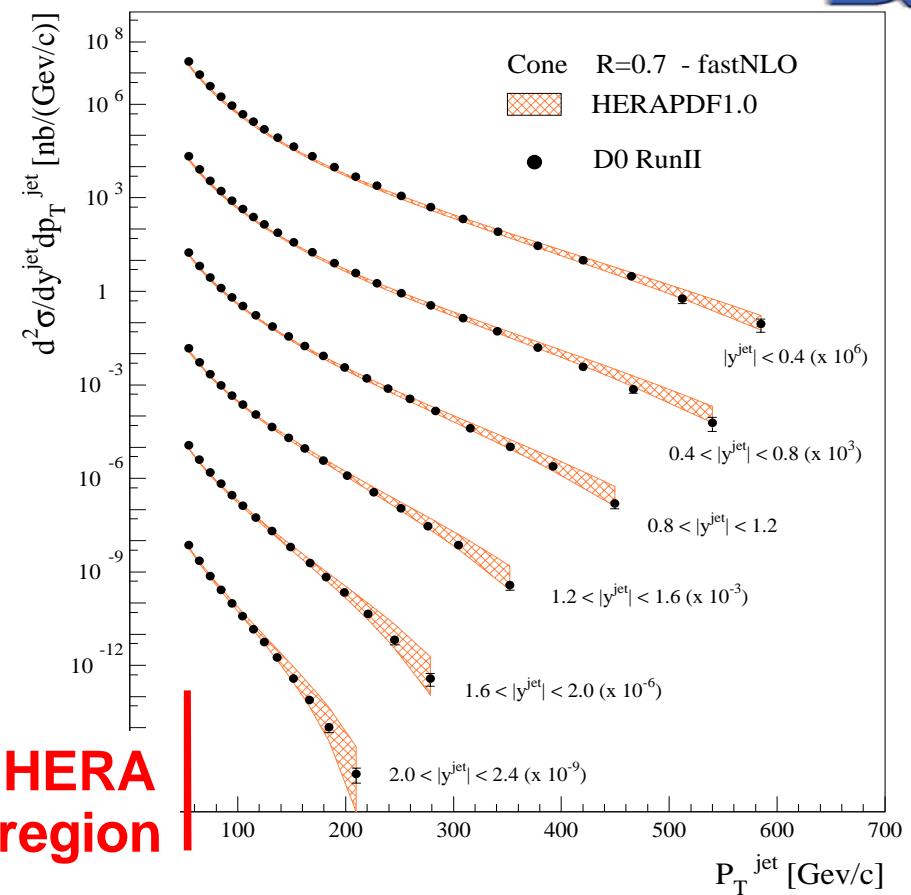

JHEP01(2010)109

Andrea Parenti

Tevatron Jet Cross Sections

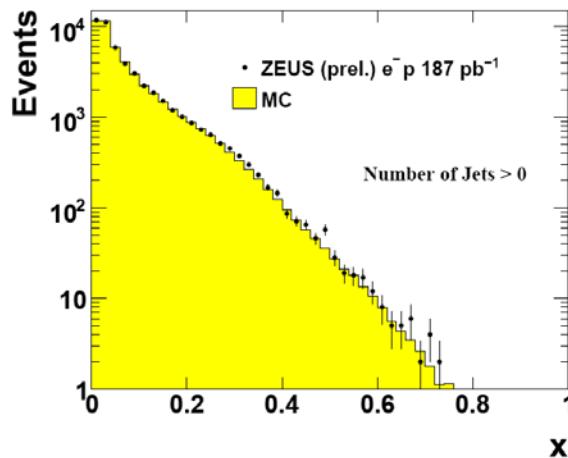

Demonstration of universal nature of the PDFs

69. PRC – Open session

10

# NC cross sections at high- $x$

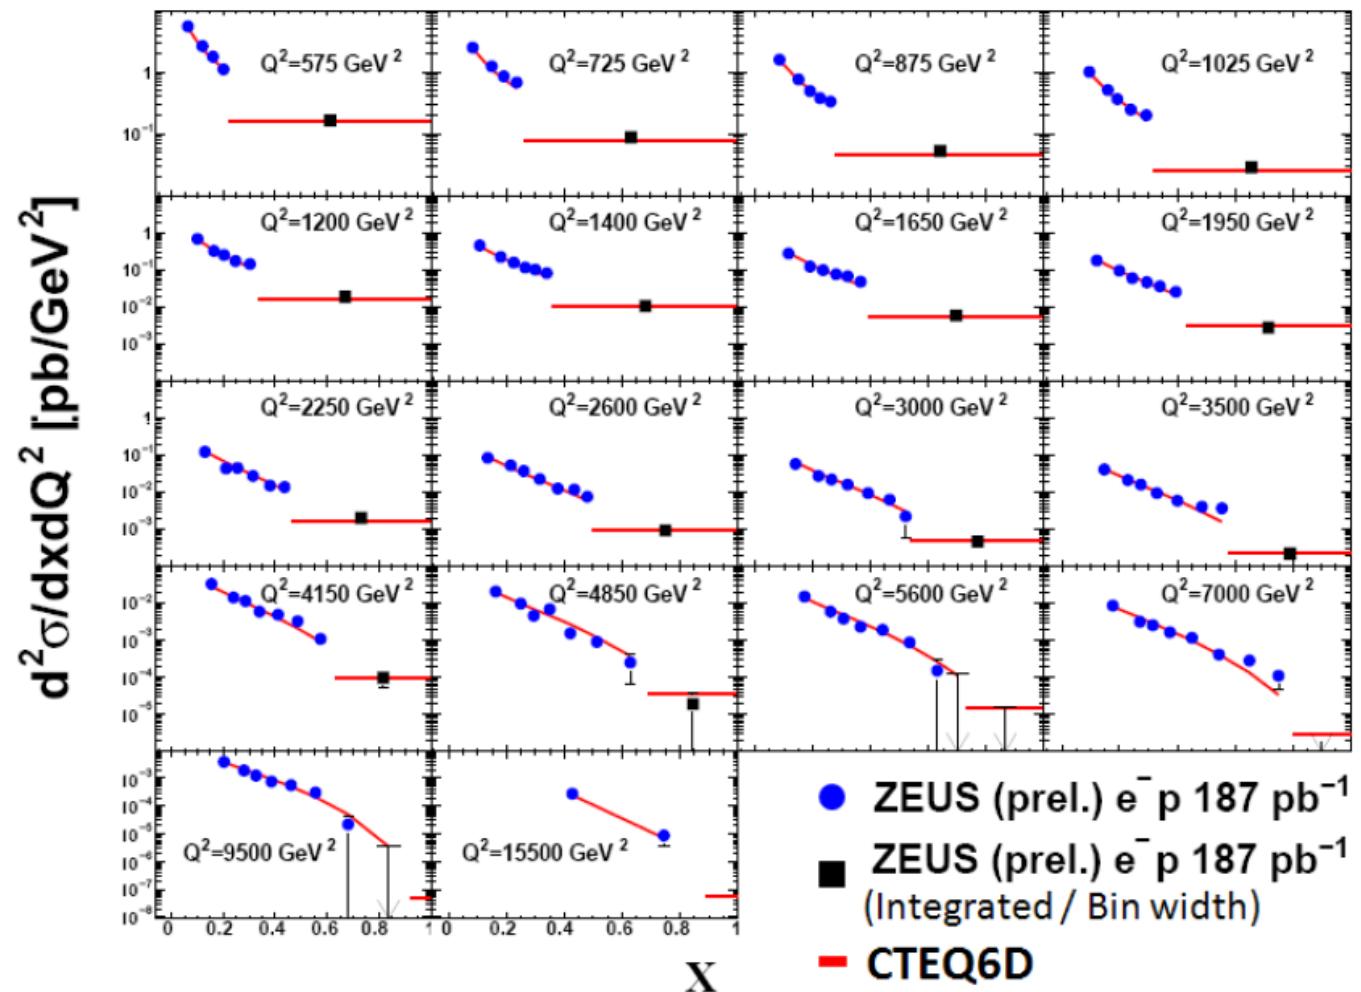

$Q^2 > 450 \text{ GeV}^2$ , 0-, 1- and multi-jet events selected.

Sensitivity to the high- $x$  region.

Impact on the PDFs still to be checked out.

ZEUS-prel-10-007

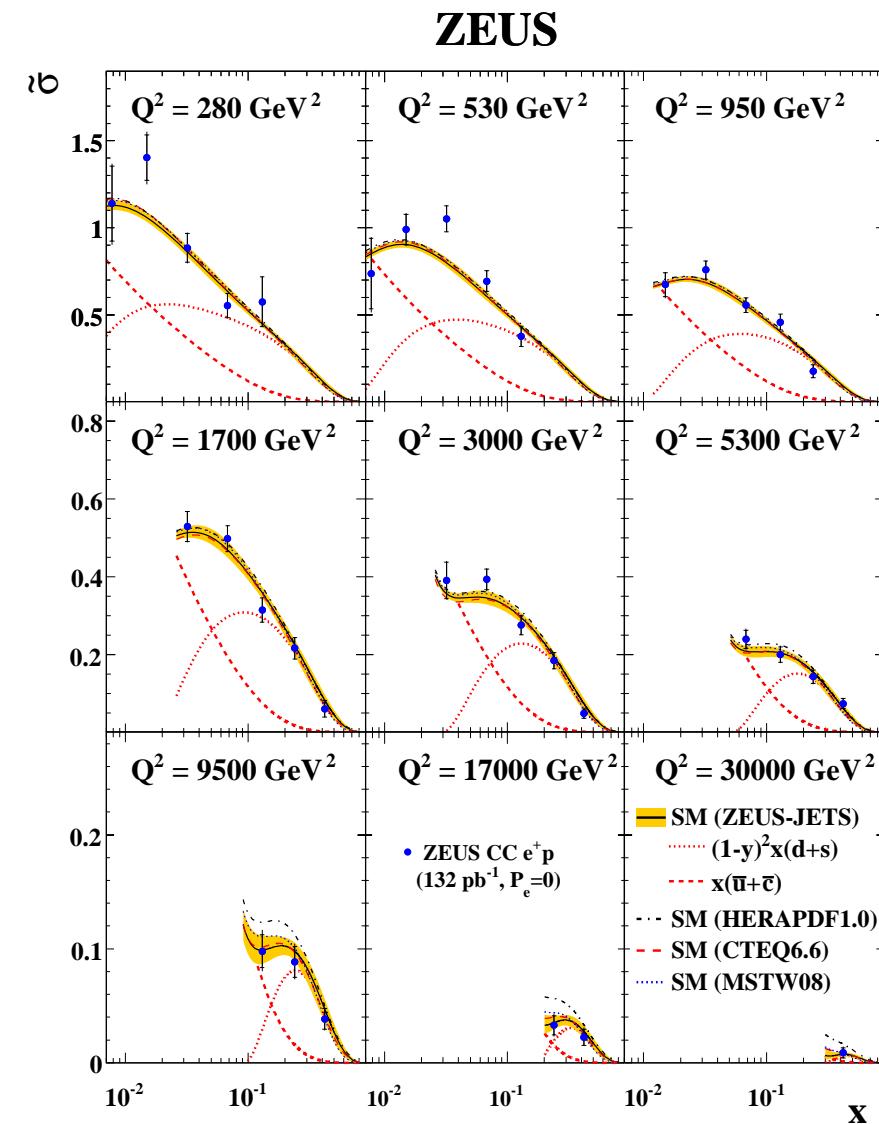

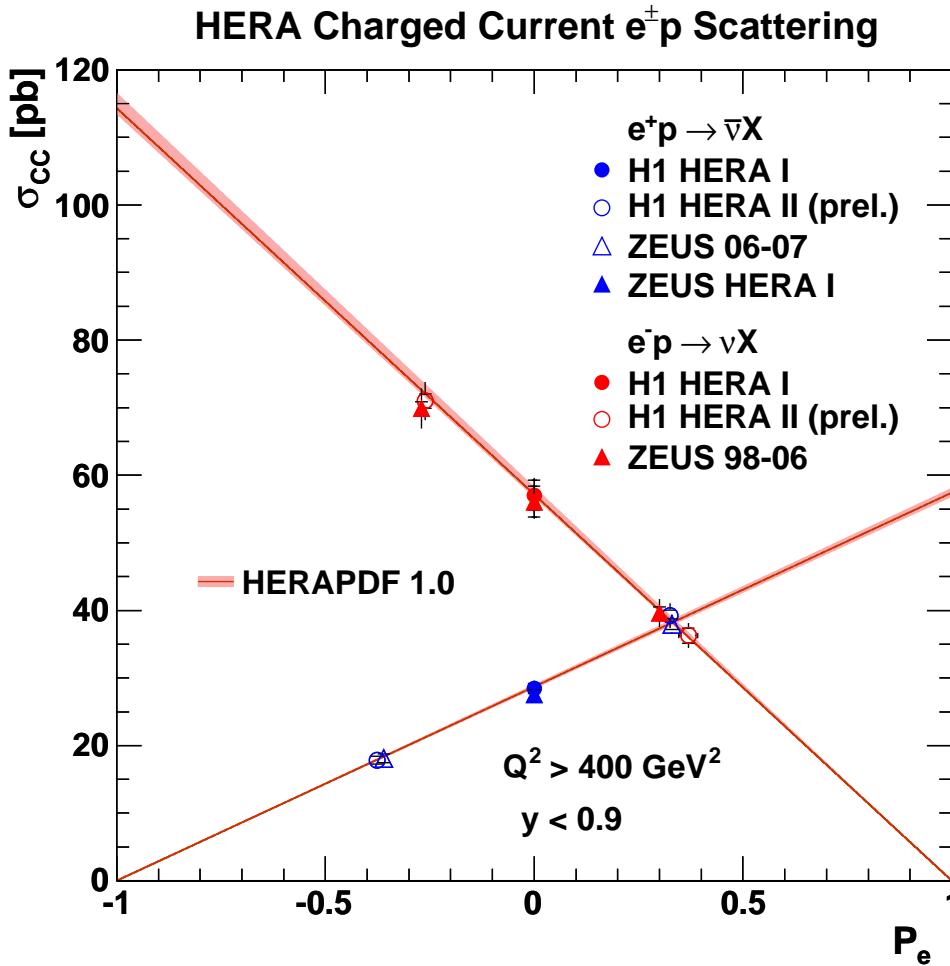

# High- $Q^2$ CC from $e^+p$ data

Final results on  $e^+p$  data,  $L=132 \text{ pb}^{-1}$ .

$200 < Q^2 < 60000 \text{ GeV}^2$

Precise input to QCD fits  $\rightarrow$  high  $x$

- Open session

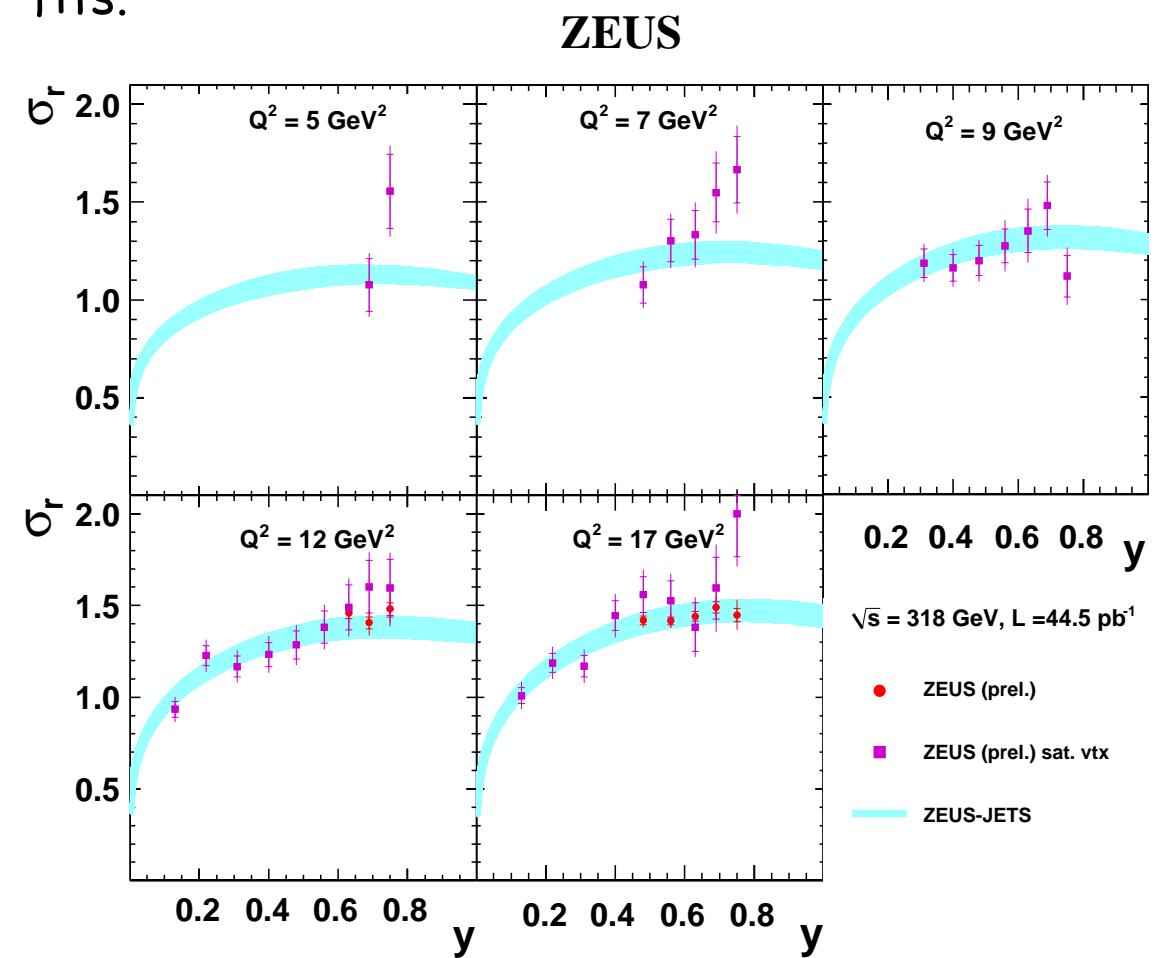

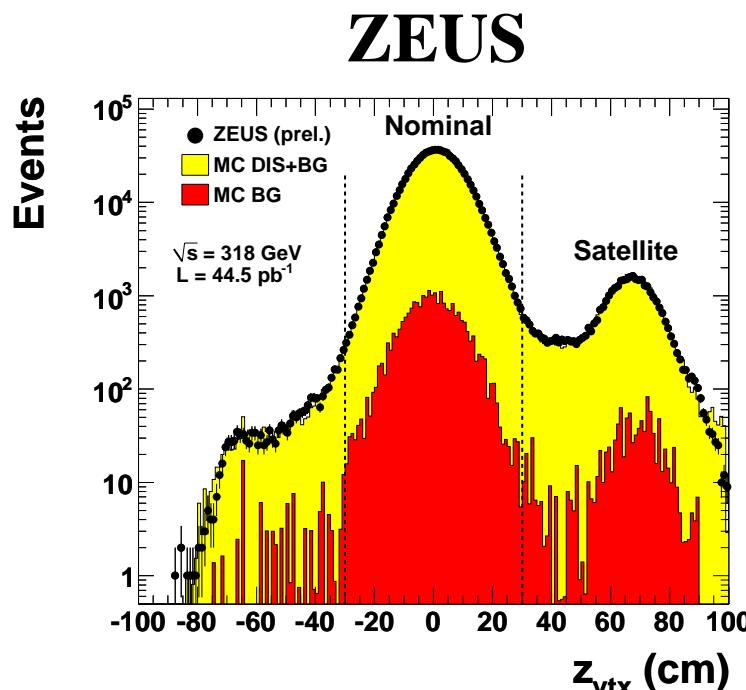

ZEUS-pub-10-004

12

# High, medium and low energy cross section at high $y$

HERA NC cross sections from data collected at  $E_p = 920, 575$  and  $460$  GeV for the  $F_L$  determination used in PDF fits.

ZEUS extends its  $Q^2$  region for all energies, down to  $5$   $\text{GeV}^2$  for HER also using shifted vertex data.

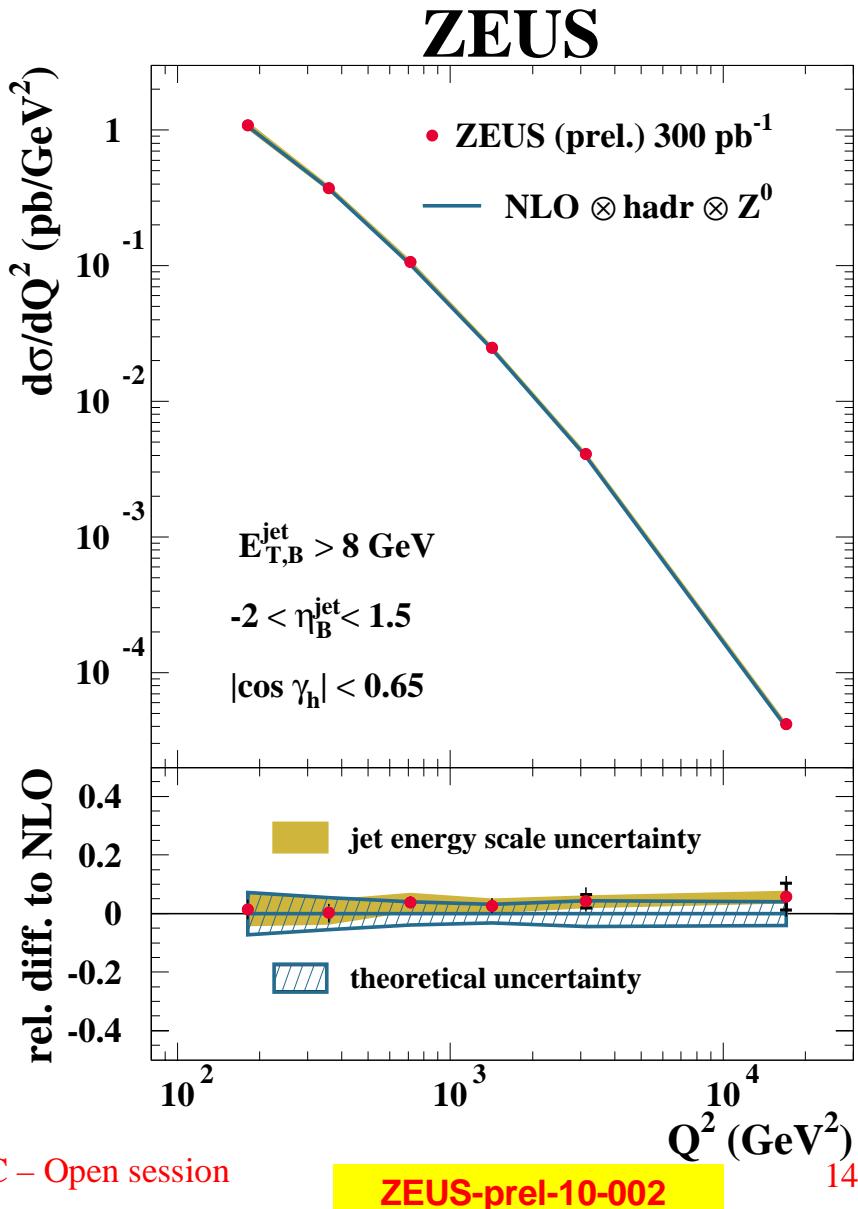

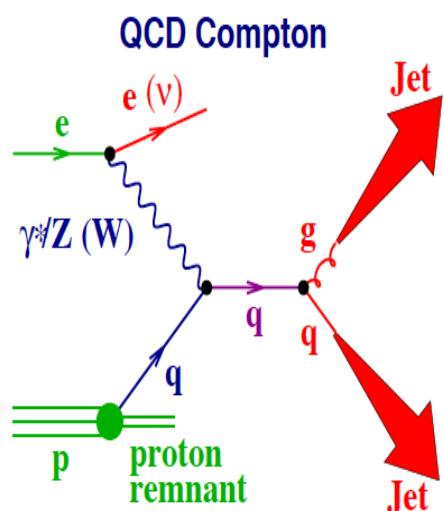

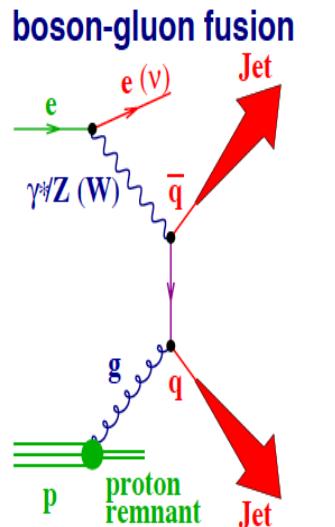

# Inclusive jets in NC DIS

Inclusive jets,  $L=300 \text{ pb}^{-1}$

Kinematic range  $Q^2 > 125 \text{ GeV}^2$ .

Good agreement with QCD at NLO.

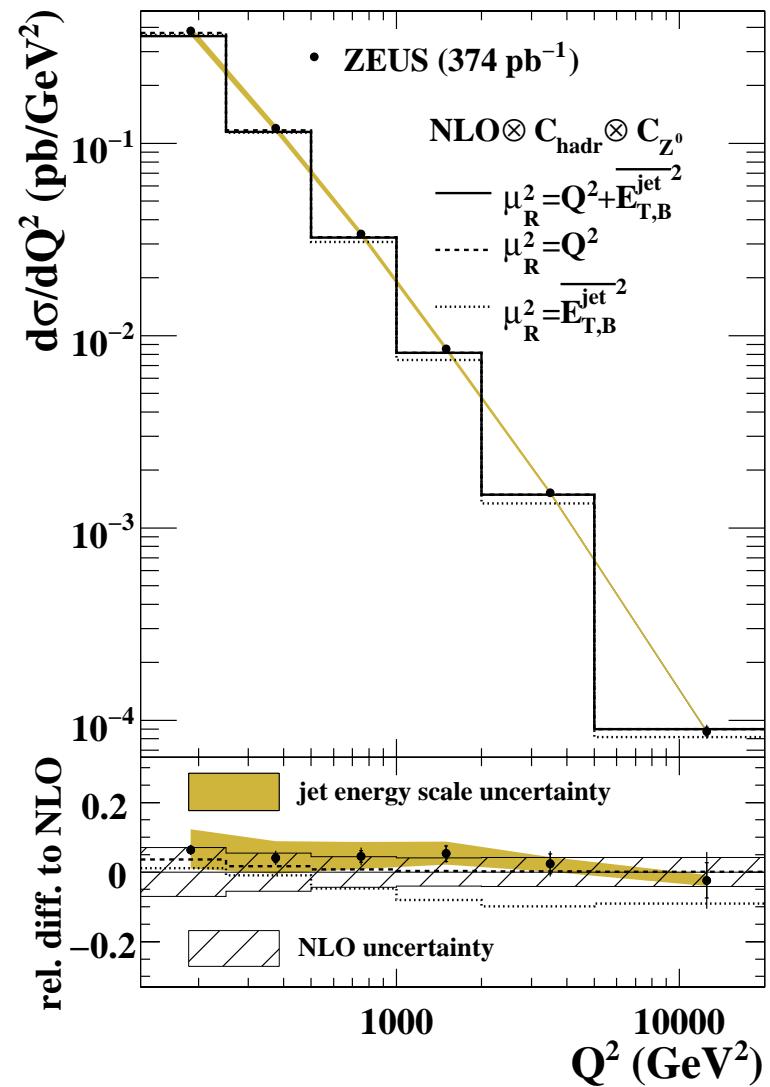

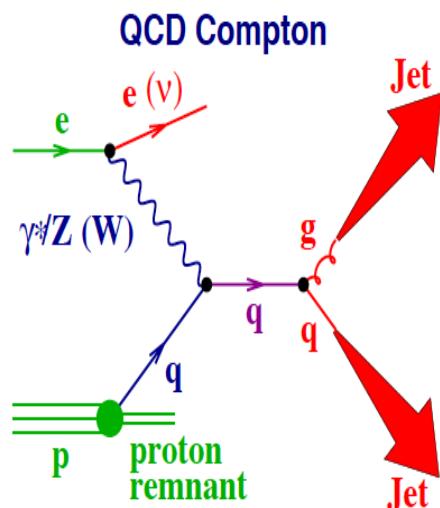

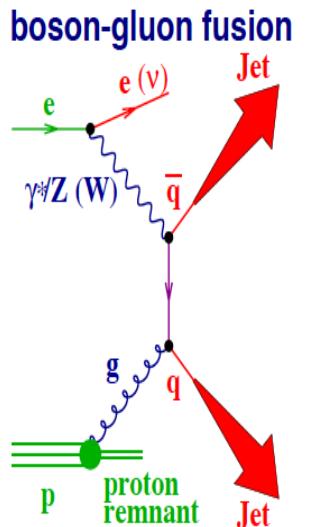

# Inclusive dijets in NC DIS

Inclusive dijets,  $L=374 \text{ pb}^{-1}$

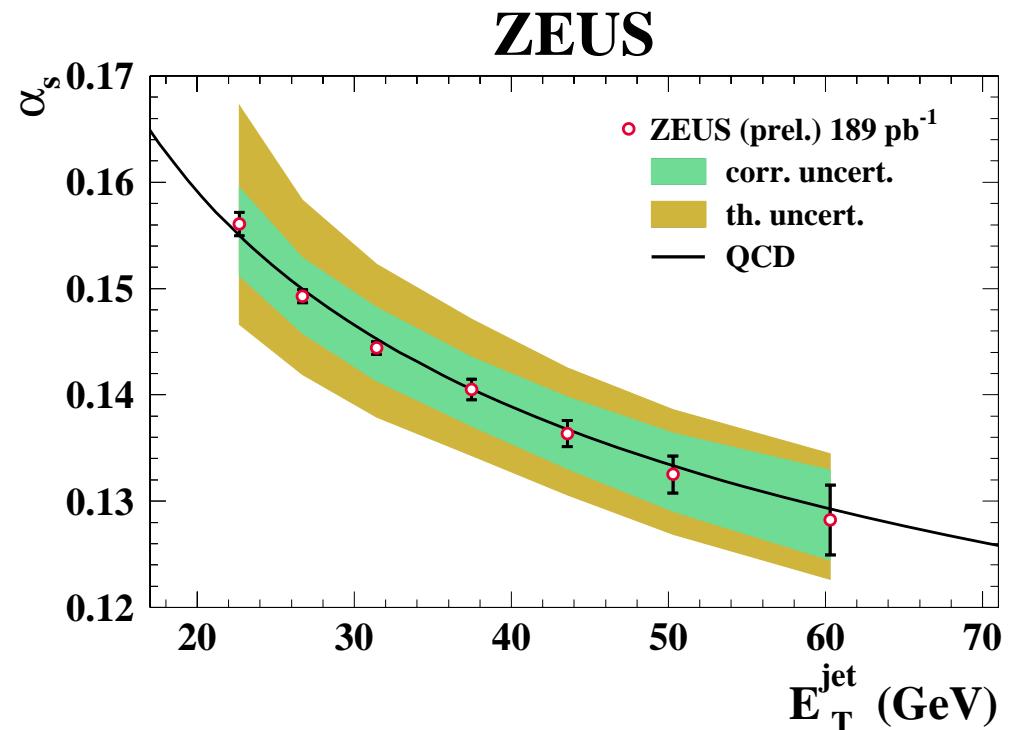

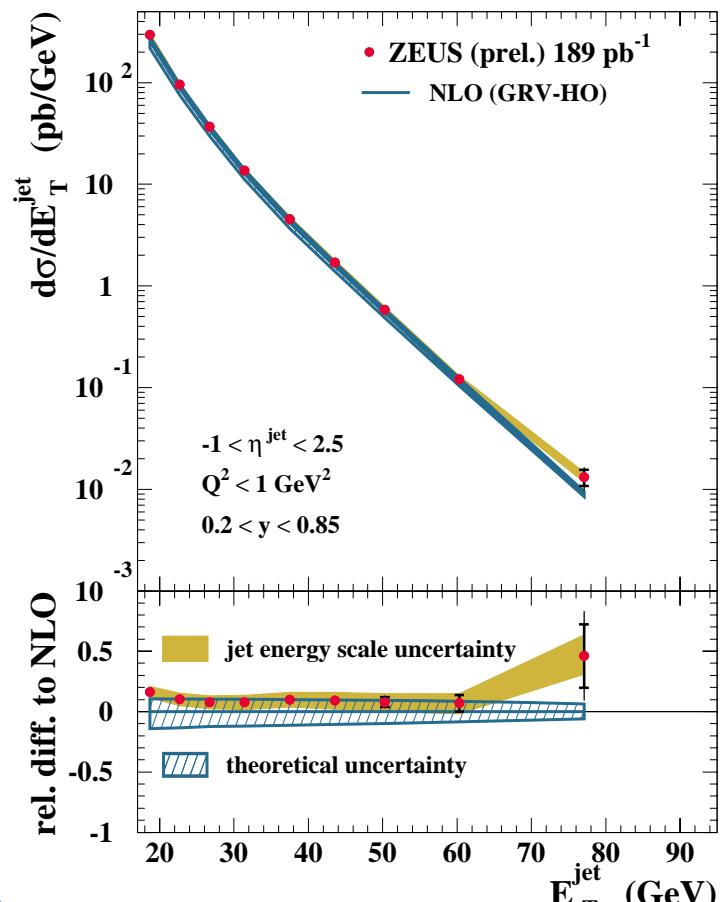

Kinematic range  $Q^2 > 125 \text{ GeV}^2$ .

Good agreement with QCD at NLO.

# Inclusive jets in PHP

$Q^2 < 1 \text{ GeV}^2$ ,  $0.2 < y < 0.85$   
 At least one jet with  
 $E_T^{\text{jet}} > 17 \text{ GeV}$ ,  $-1 < \eta_{\text{jet}} < 2.5$

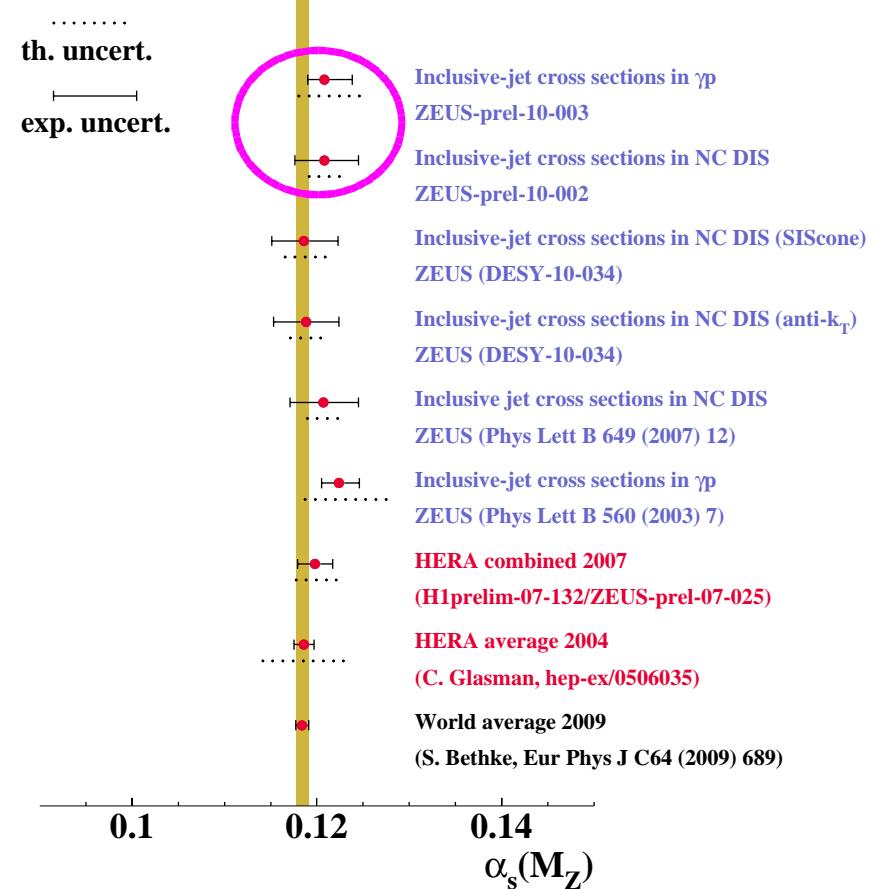

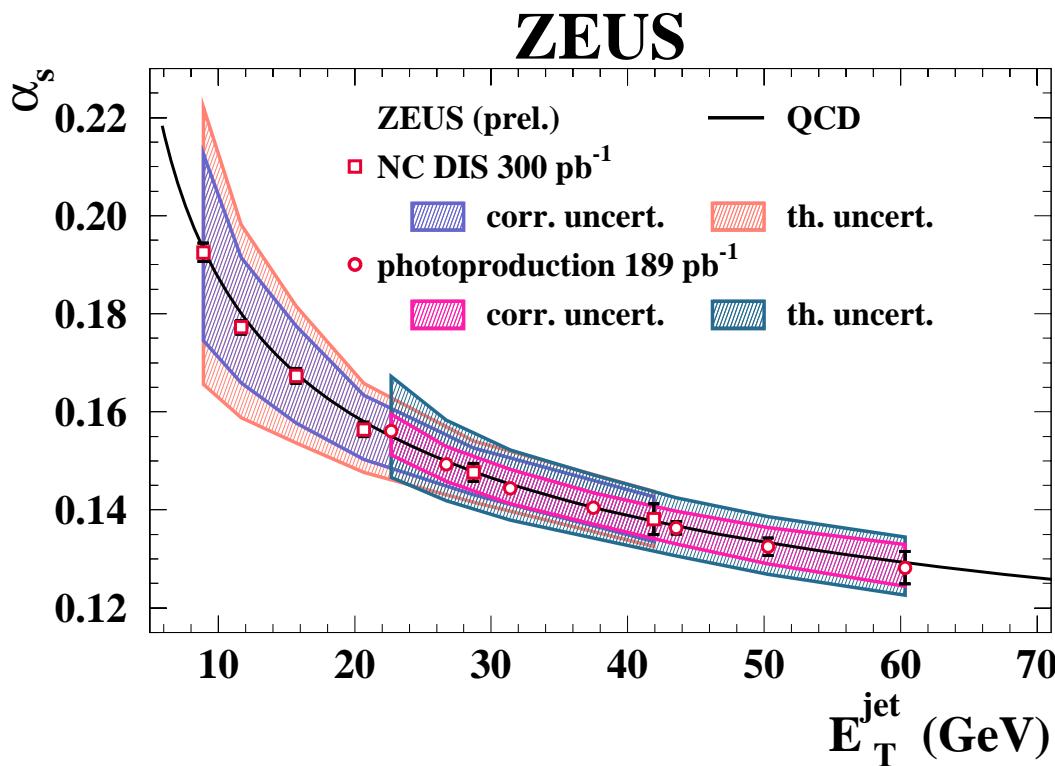

$\alpha_s$  extracted from the dependence of the cross section on  $E_T$ . Jets in PHP gave the most precise  $\alpha_s$  measurement at ZEUS, now extended to HERAII

Test of the running of  $\alpha_s$ .

# $\alpha_s$ running from PHP to DIS

Running of the coupling constant  
with the scale tested from the  
low to the high  $Q^2$  regime.

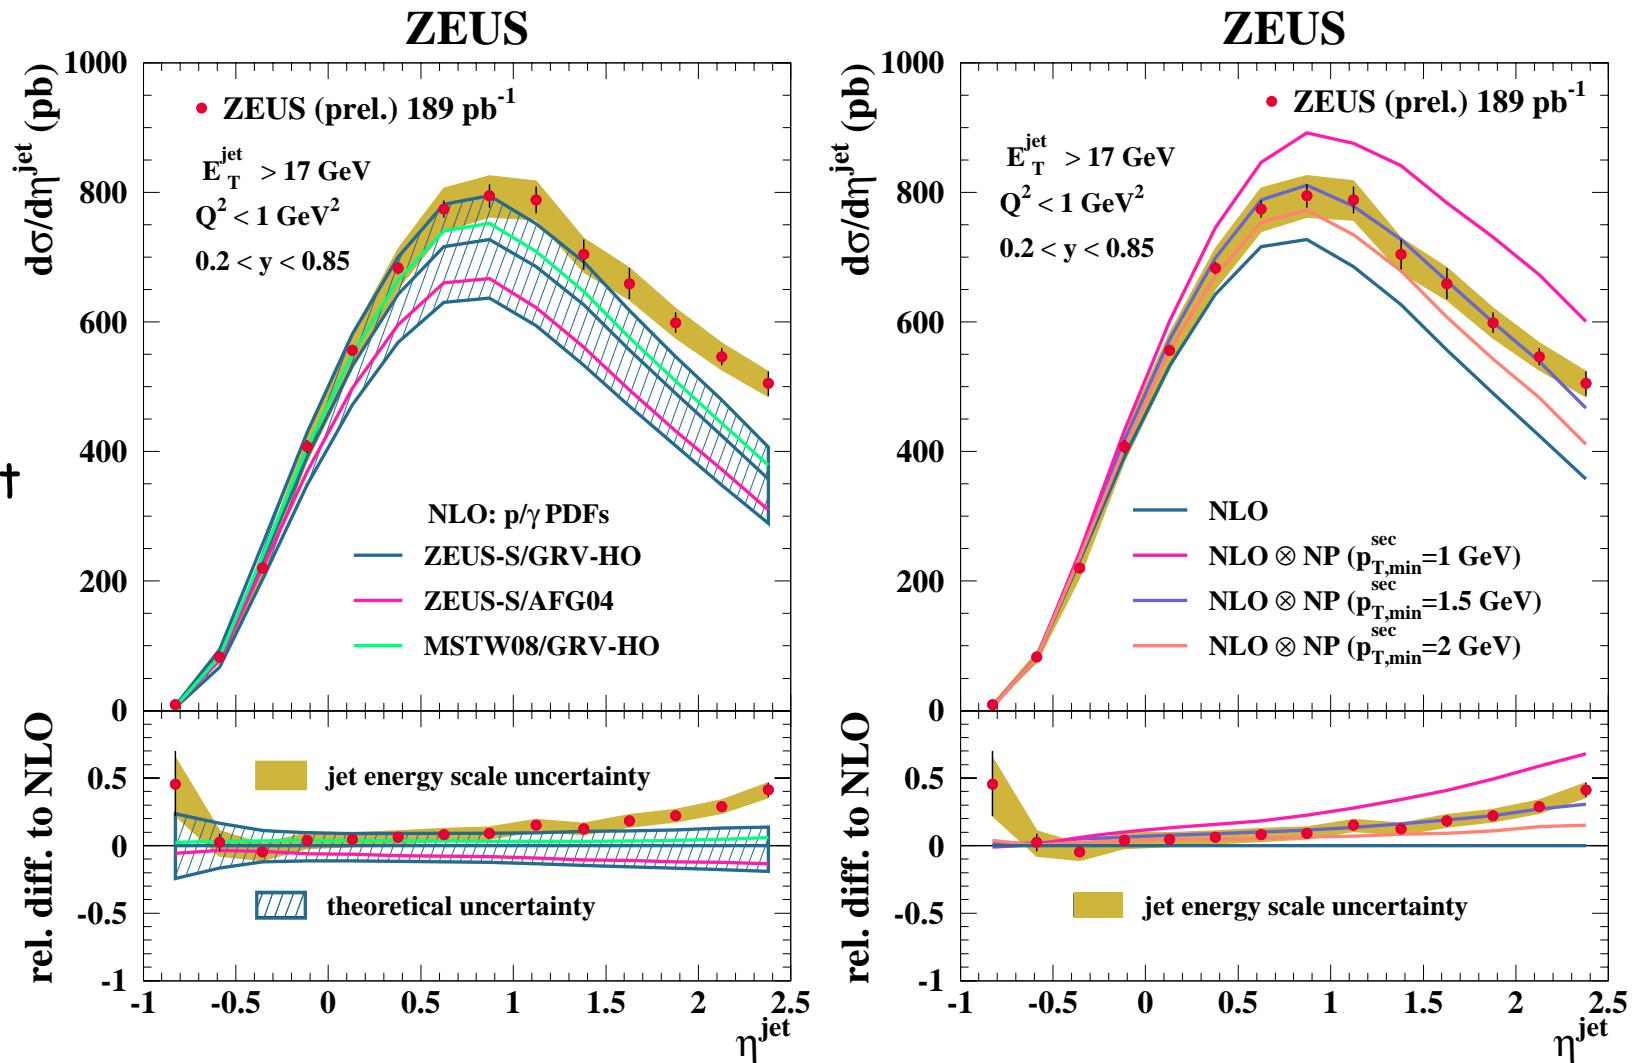

Two new precise  $\alpha_s$  measurements from  
DIS and PHP in agreement with the  
world average.

# Jets in PHP: non perturbative effects

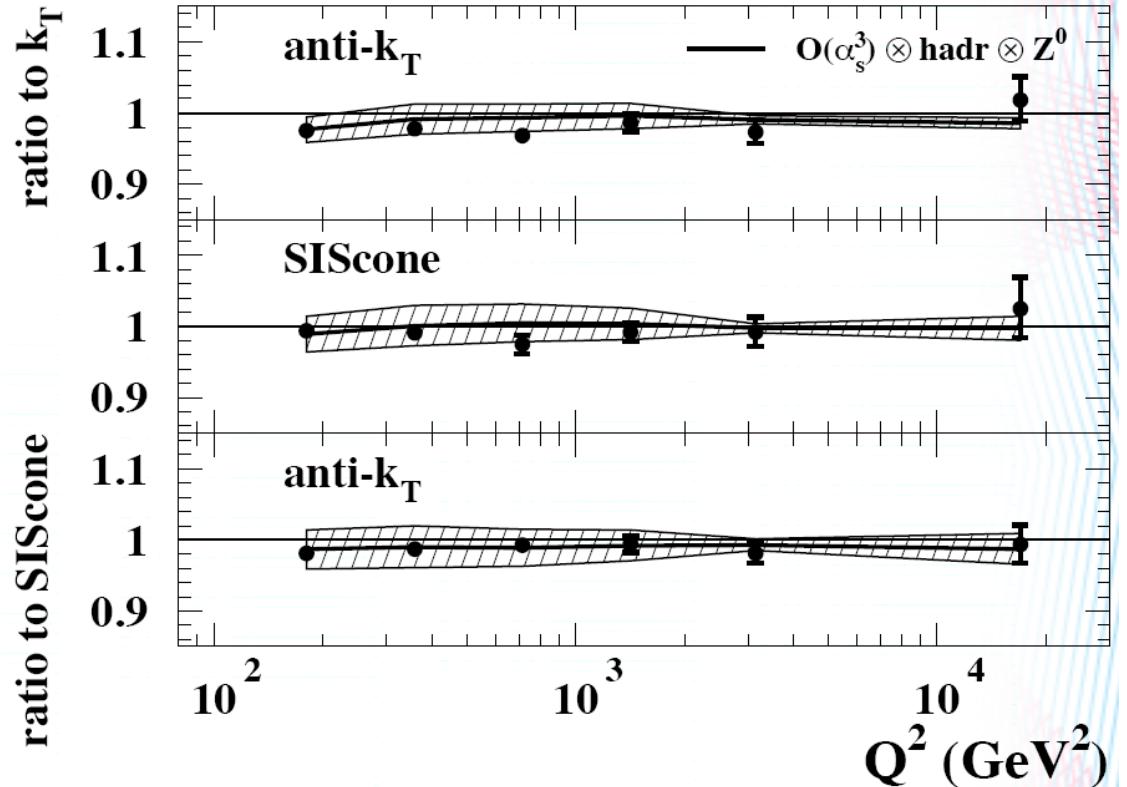

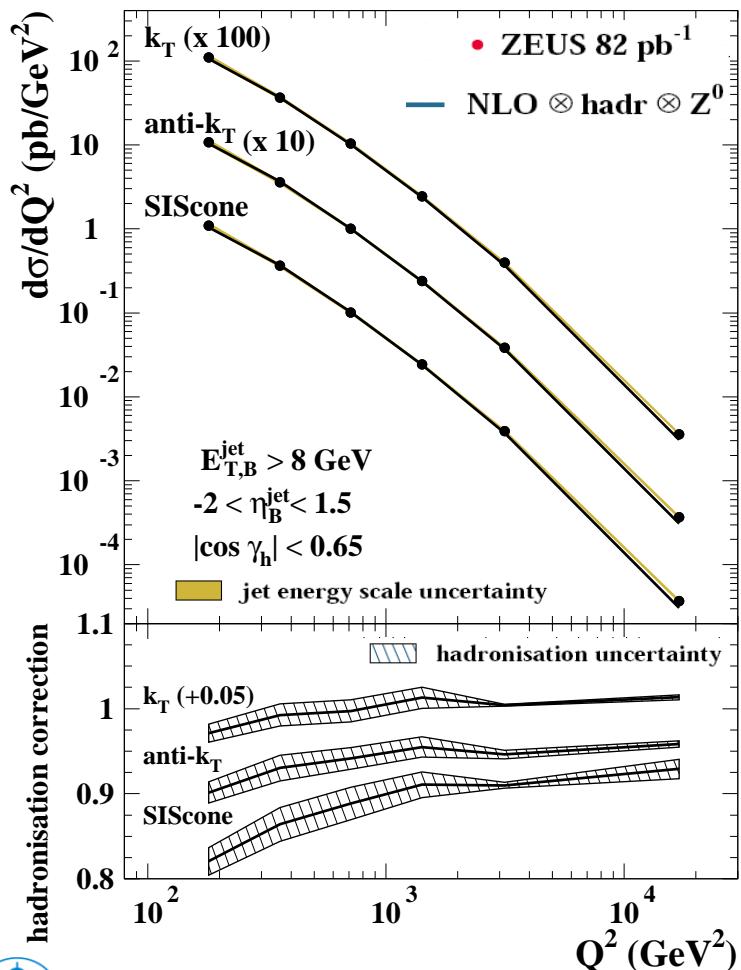

Check multiple interactions (low  $E_T^{jet}$ ), important for the LHC

This can also be influenced by the jet algorithm, new developments being tested for the LHC (anti- $k_T$ , SIScone...)

# Anti- $k_T$ and SIScone jet algorithms

Reanalysis of inclusive jets in DIS  
( $k_T$  used originally)

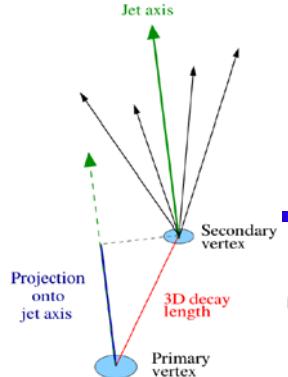

Data very well described by NLO and all the algorithms.  
Similar precision (slightly worse for SIScone)

Ratios evaluated up to order  $\alpha_s^3$

First test on data,  
important for LHC

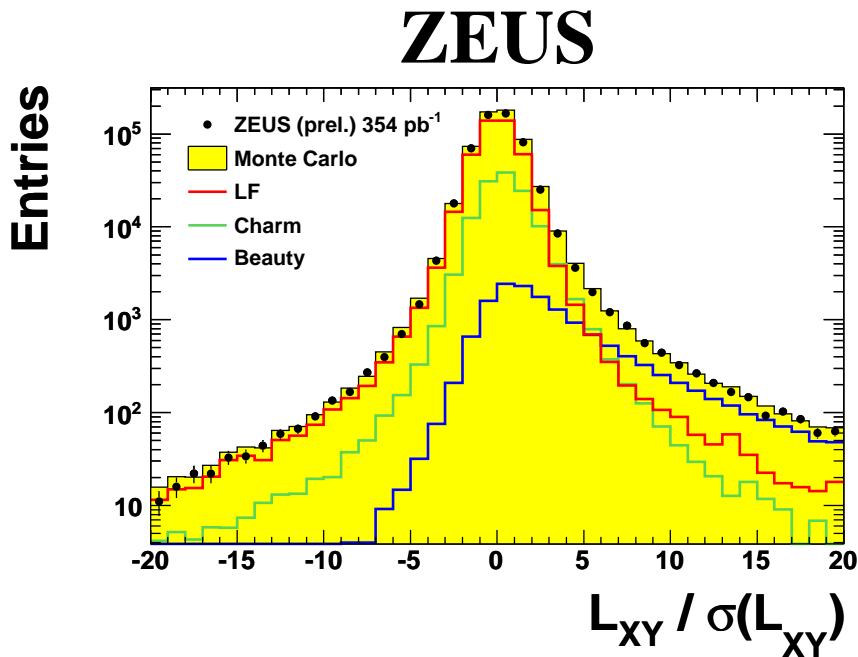

# Beauty in DIS

Beauty reconstructed from jets  
with secondary vertices.

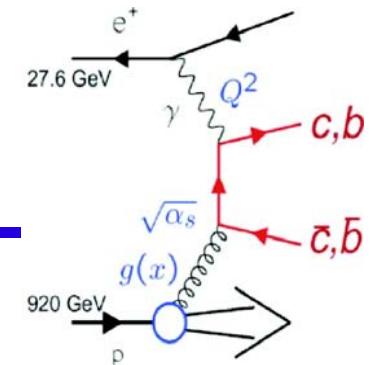

$5.0 \text{ GeV}^2 < Q^2 < 1000.0 \text{ GeV}^2, 0.02 < y < 0.7$   
 $E_T(\text{Jet}) > 5.0 \text{ GeV}, -1.6 < \eta(\text{Jet}) < 2.2$

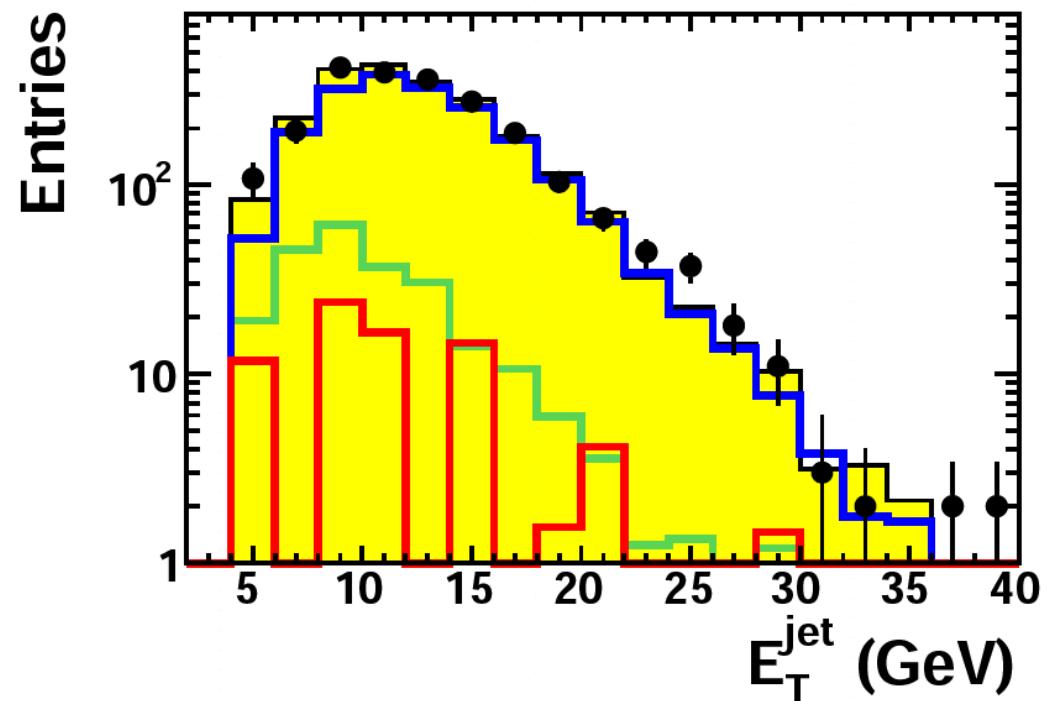

90000 beauty events available

Andrea Parenti

$L=354 \text{ pb}^{-1}$

Very high purity at high mass  
and significance

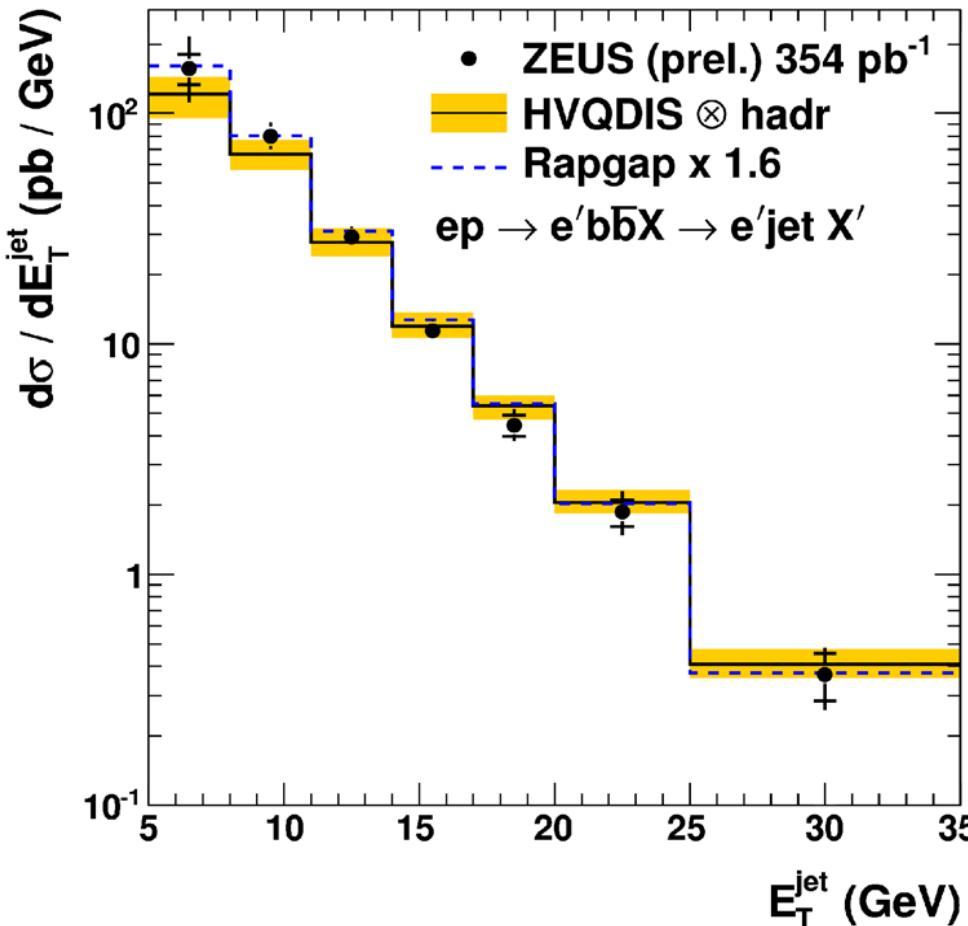

# Beauty in DIS

$5.0 \text{ GeV}^2 < Q^2 < 1000.0 \text{ GeV}^2, 0.02 < y < 0.7$

$E_T(\text{Jet}) > 5.0 \text{ GeV}, -1.6 < \eta(\text{Jet}) < 2.2$

$L=354 \text{ pb}^{-1}$

ZEUS-prel-10-004

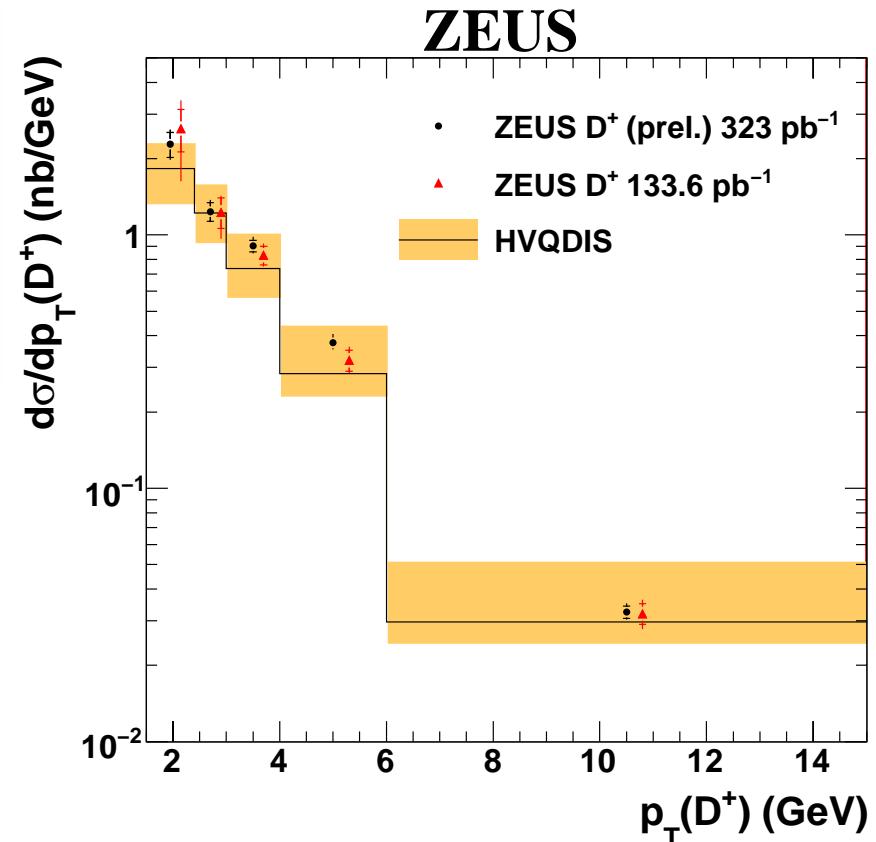

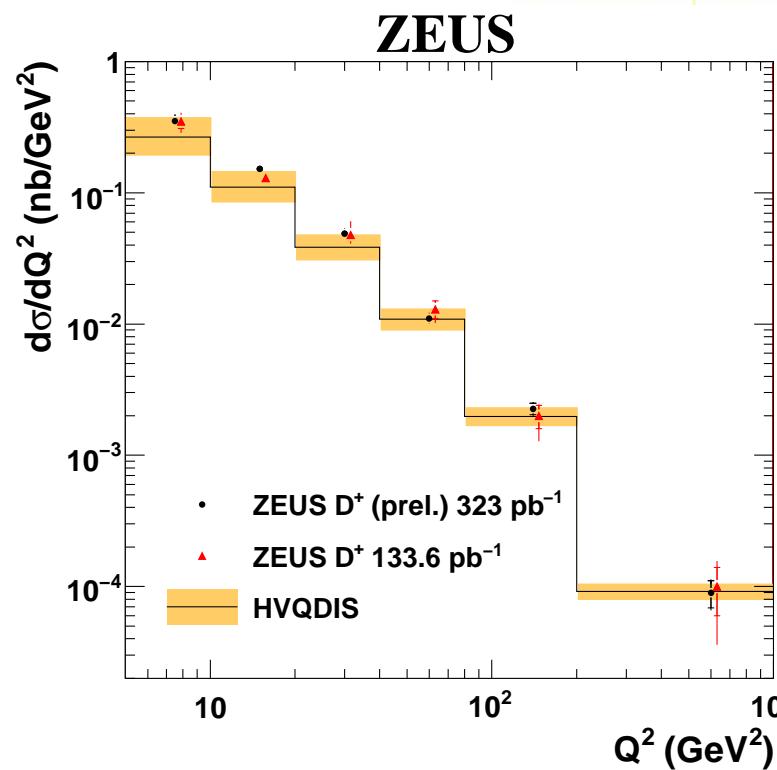

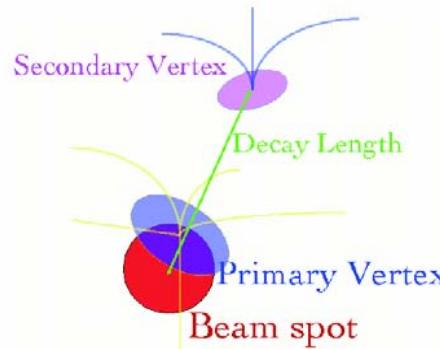

Data will be used for the extraction of  $F_2^b$

# D<sup>+</sup> in DIS

D<sup>+</sup> reconstructed using lifetime information. L=323 pb<sup>-1</sup>.

$$\begin{aligned} 5 < Q^2_{DA} &< 1000 \text{ GeV}^2 \\ 0.02 < \gamma_{DA} &< 0.7 \\ 1.5 < p_T(D^+) &< 15 \text{ GeV} \\ |\ln(D^+)| &< 1.6 \end{aligned}$$

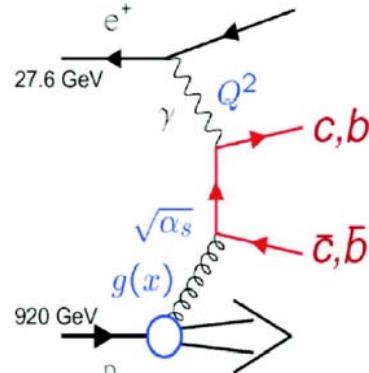

~ 7200 D<sup>+</sup> events available

Precision comparable to D<sup>\*</sup> in HERA I

# New ZEUS $F_2^{c\bar{c}}$

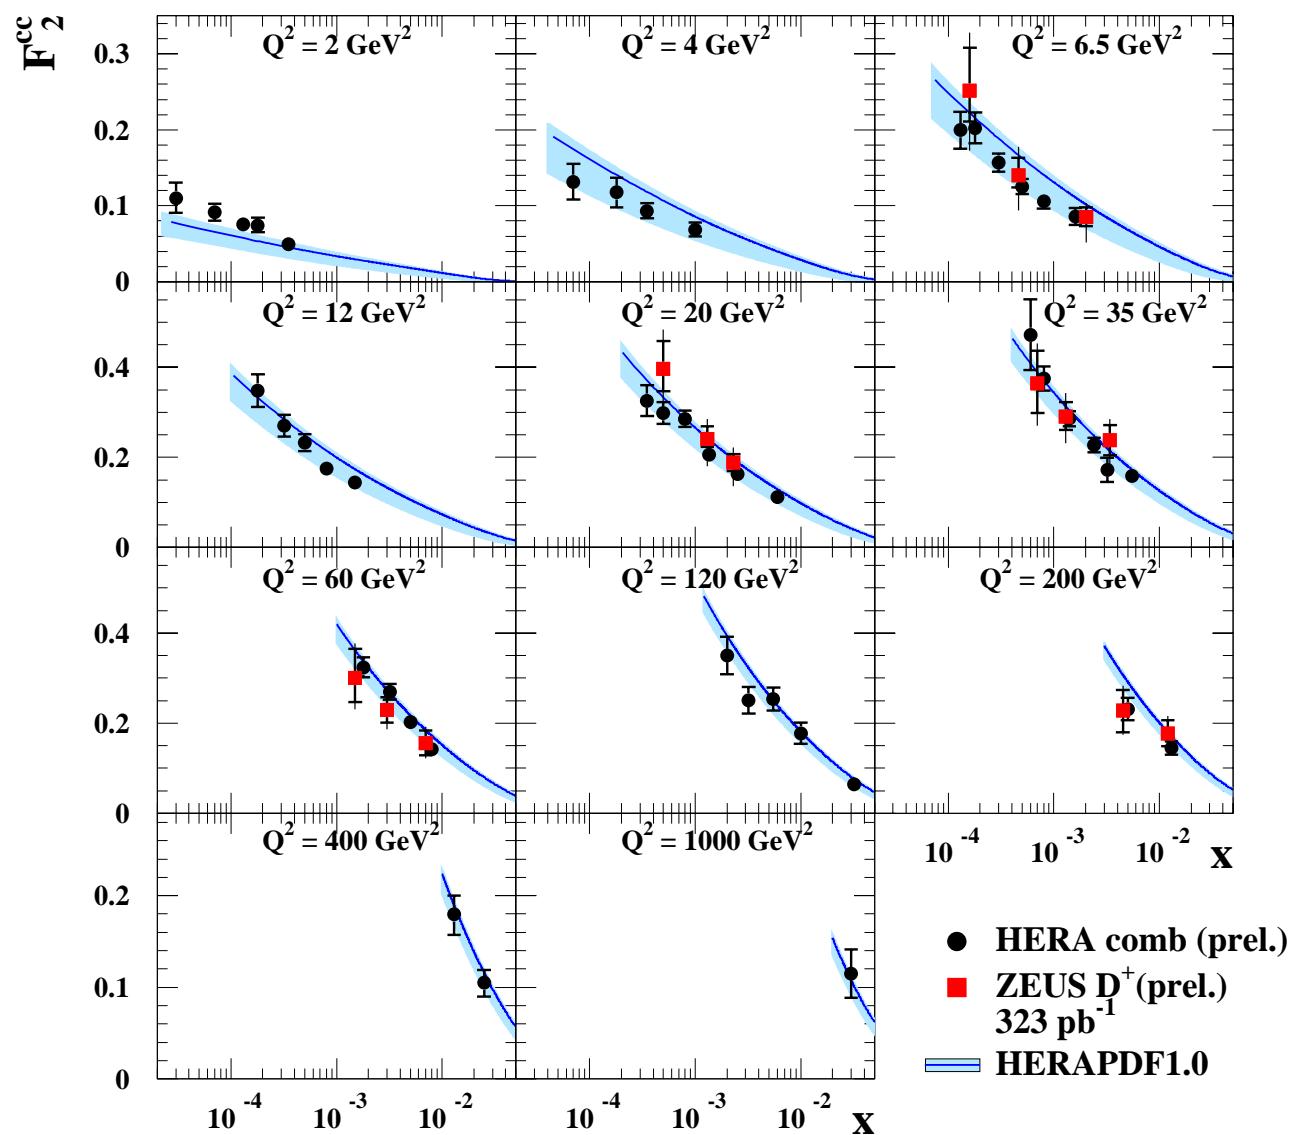

Sensitivity to the gluon.

New  $D^+$  data used to extract  $F_2^c$  with good precision.

Here results are compared with data from H1 and ZEUS combined.

New data will help to improve the precision of the combination.

# Conclusions

---

- Lively, active physics analyses
  - publishing many papers
  - many new preliminary results
  - fully committed to combinations
  - fighting for manpower, but clear priorities
- Still significant technical improvements
  - e. g. lumi ( $2.6\% \rightarrow 1.8\%$  impacts on  $\alpha_s$ )
- Plan for data preservation in hand
  - What resources will be available?

# Backup

# QCD at HERA

NC and CC cross sections main input to QCD fits → **HERAPDF1.0**

Extension to the high- $Q^2$  and  $x$  region

Extension to the low- $Q^2$  region at high- $y$ :

check of DGLAP evolution

check of QCD predictions for  $F_L$

Inclusion of jet data and HFL data → sensitivity to the gluon

Provide precise input to QCD fits

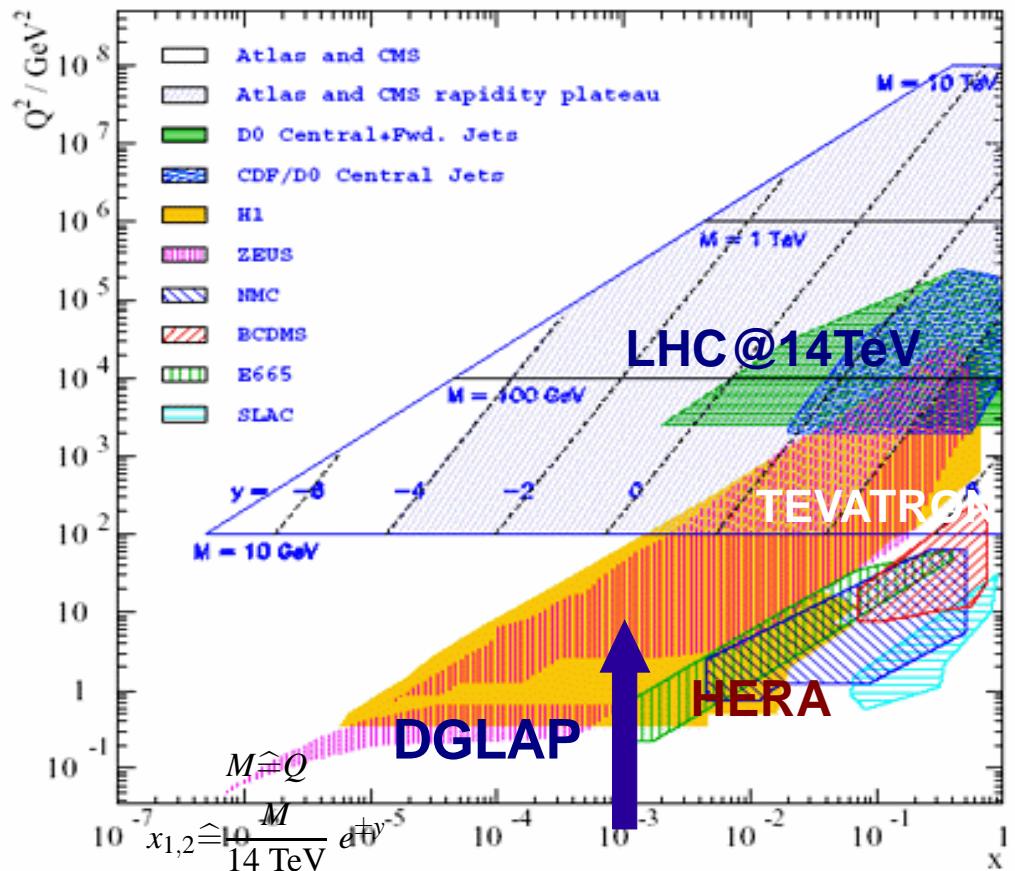

FIG. 1: Kinematic coverage of the DIS and collider  $p p - p \bar{p}$  experiments. For  $p p$  and  $p - \bar{p}$  colliders, the Bjorken  $x_1$  and  $x_2$  of the interacting quarks are related to the mass  $M$  of the Drell-Yan pair and its rapidity  $y$  as  $x_{1,2} = M/\sqrt{S} \exp(\pm y)$  where  $S$  is the center of mass energy squared for the experiment.

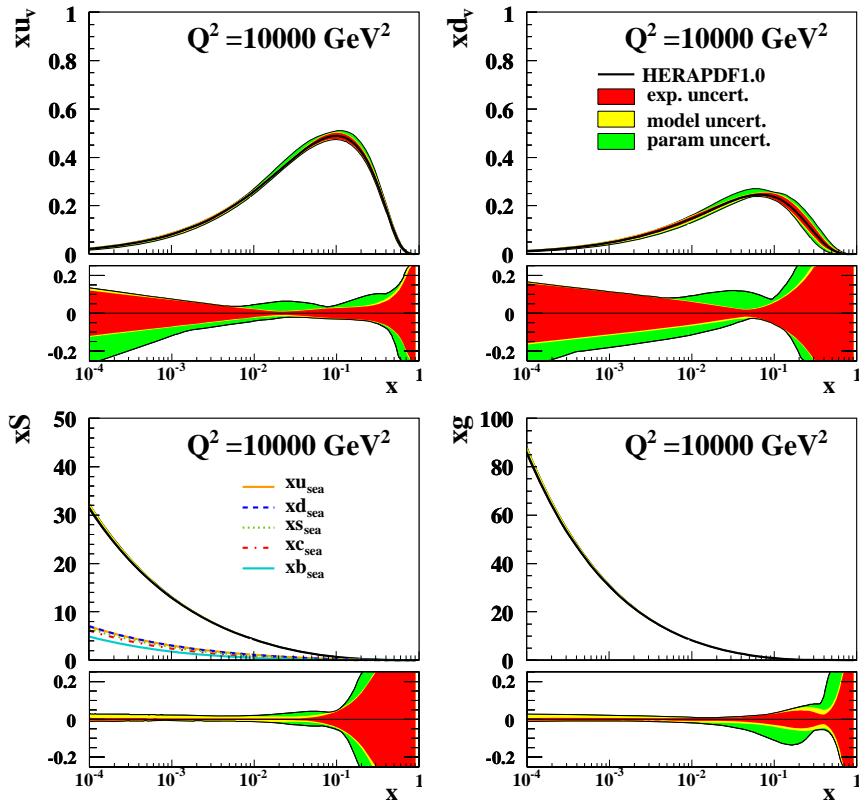

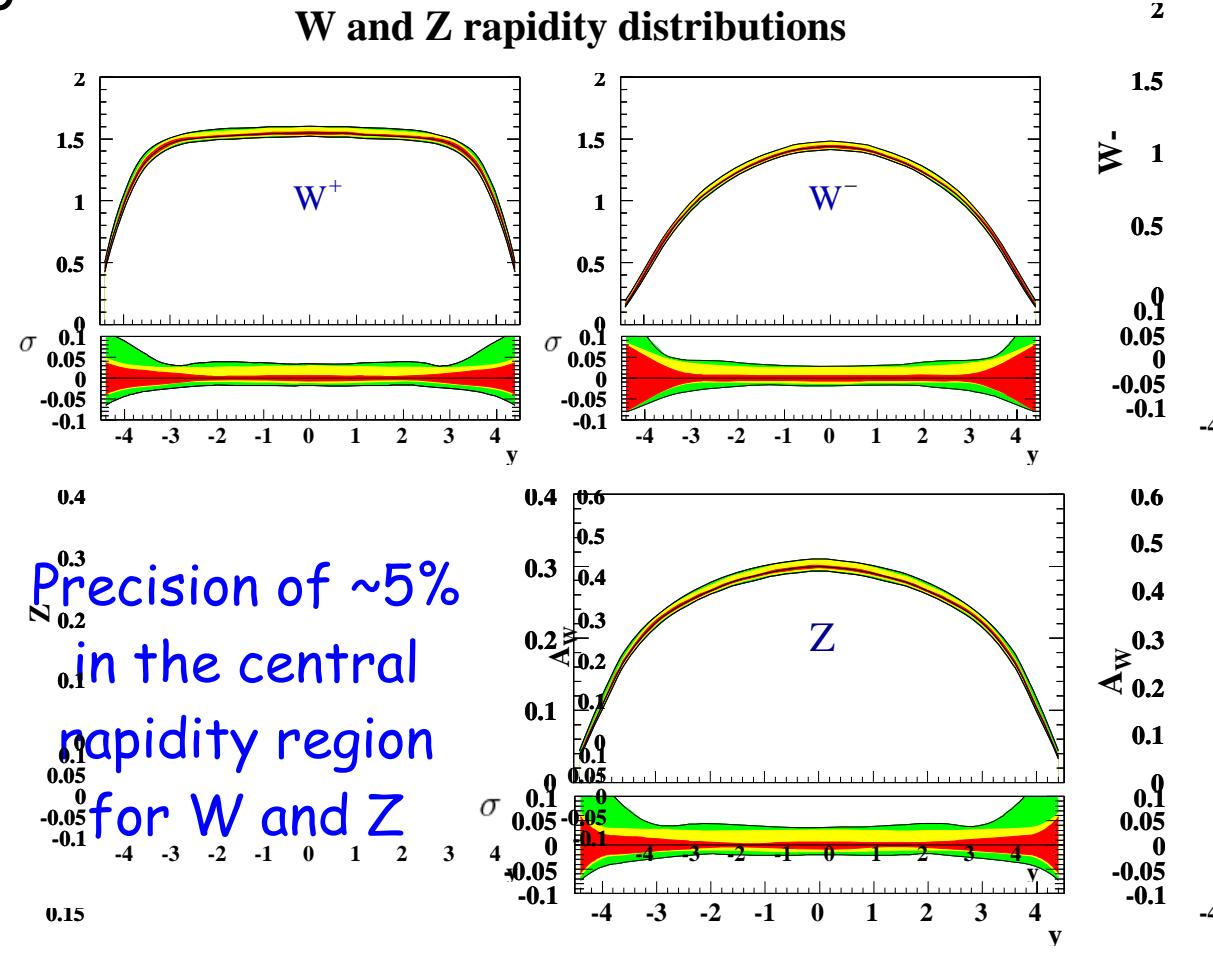

# HERAPDF1.0

The combined NC and CC HERA data have been used as the sole input for W and Z rapidity distributions

H1 and ZEUS

W and Z rapidity distributions

Precision of ~5%  
in the central  
rapidity region  
for W and Z

Precise picture of the proton

$R_{\text{RW}}$

$R_{\text{ZW}}$

HERAPDF1.0

exp. uncert.

model uncert.

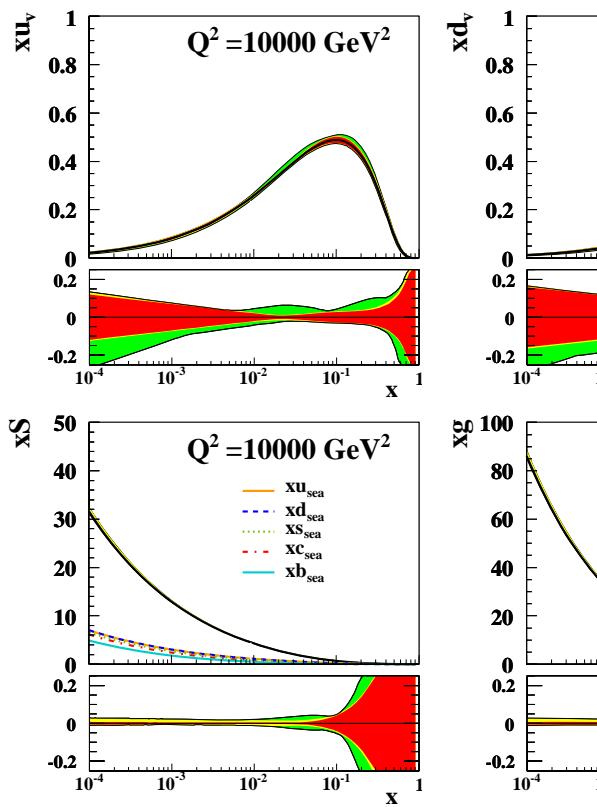

param. uncert.

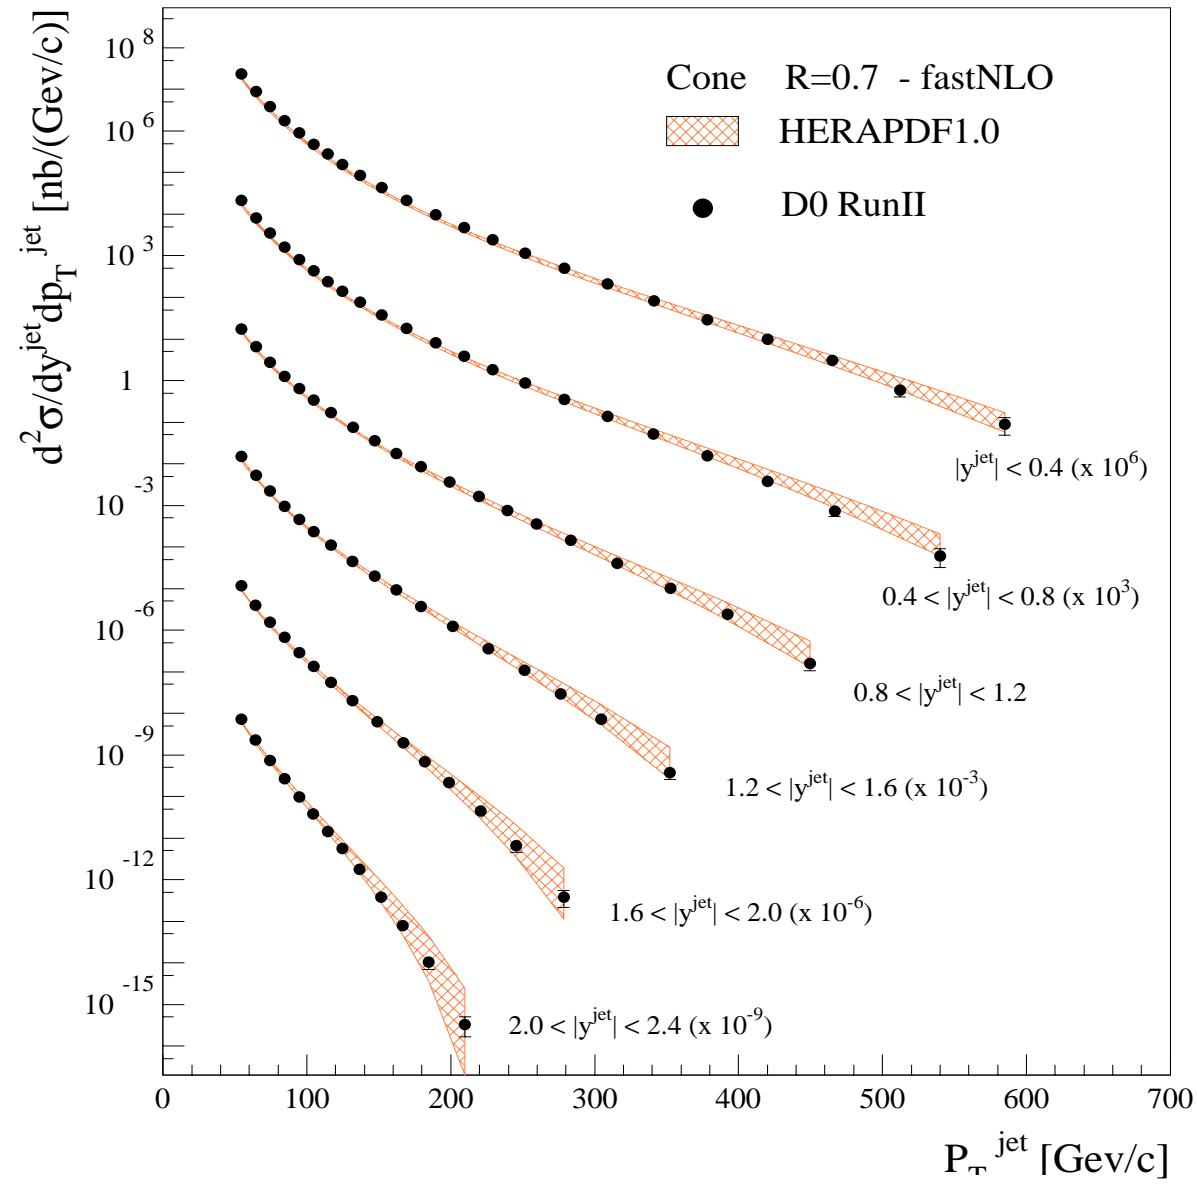

JHEP01(2010)109

## The combined NC and the extraction of the H1 and ZEUS

## Tevatron Jet Cross Sections

JHEP01(2010)10^n

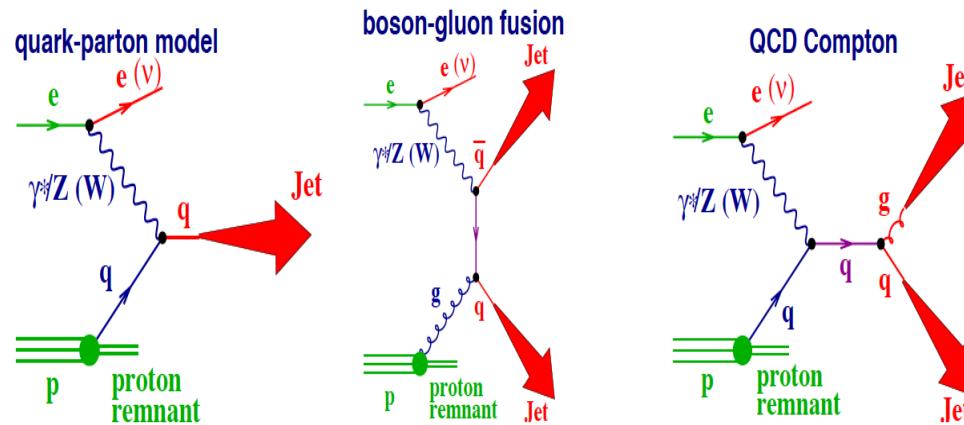

HERAPDF1.0 able to describe high-x jet production

t.  
param uncert

# Jet cross sections

Stringent test of perturbative QCD

Sensitivity to the gluon in the proton, precise input to QCD fits.

Extract  $\alpha_s$  with high precision, check the scale dependence within a single experiment and in different regimes.

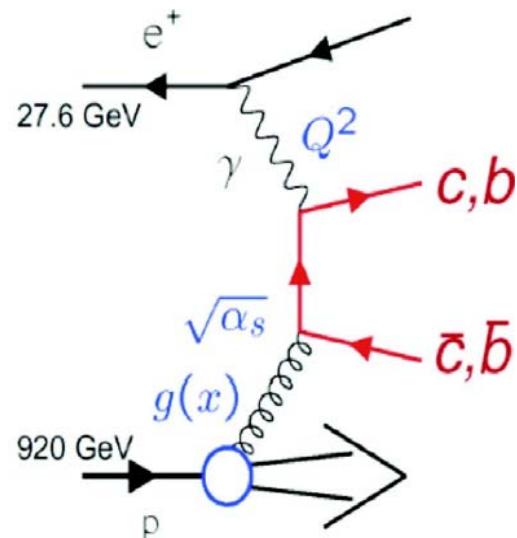

# Charm and beauty production

---

Stringent test of perturbative QCD, sensitivity to the gluon in the proton.

Multi-scale problem (mass,  $p_T$ ,  $Q^2$ )

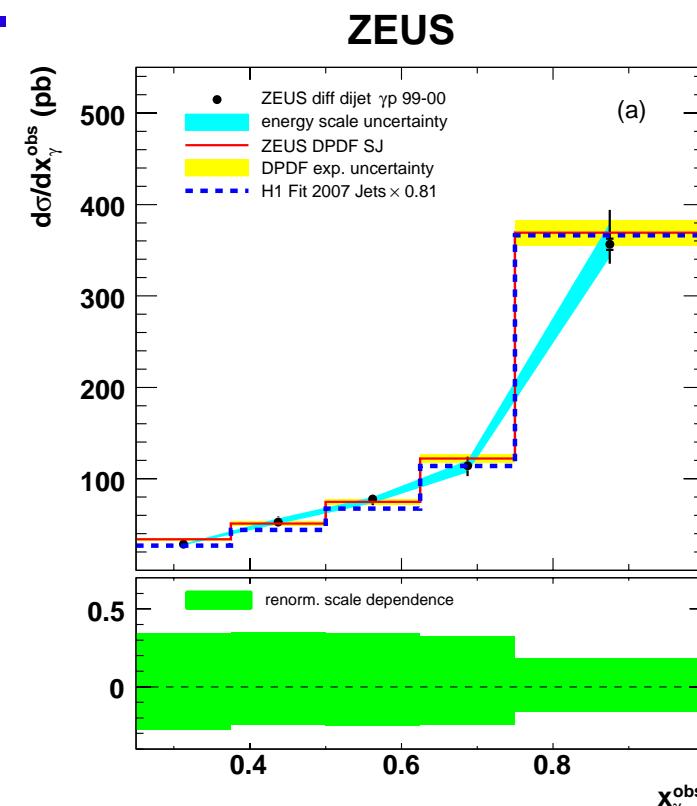

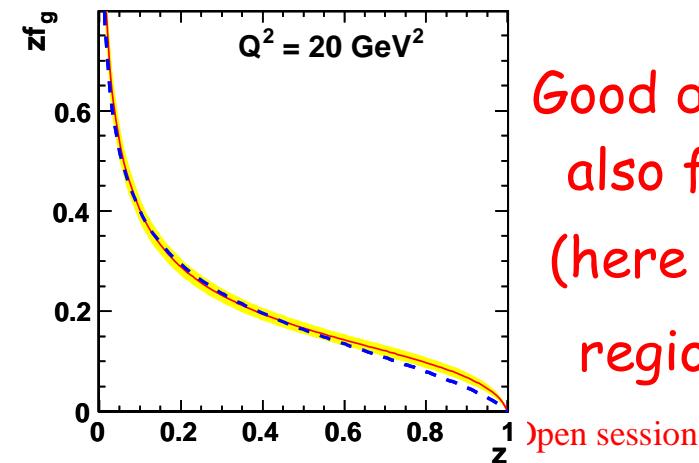

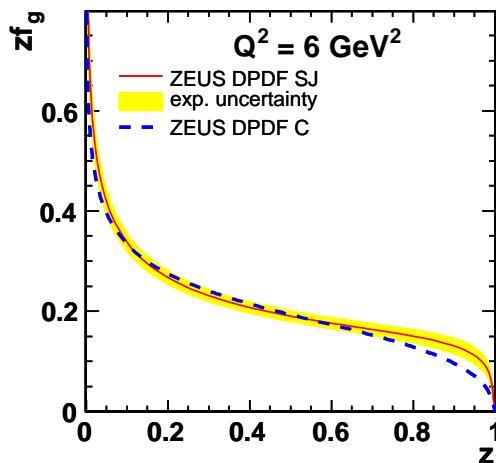

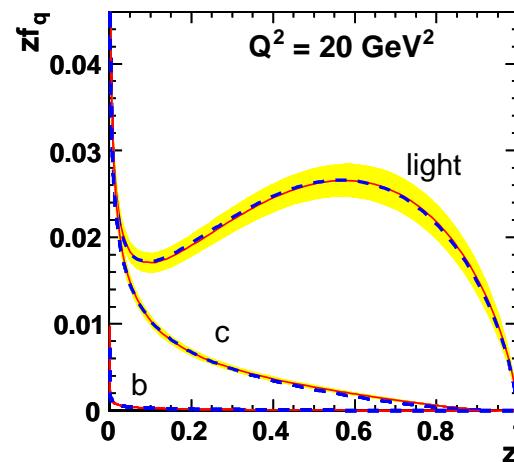

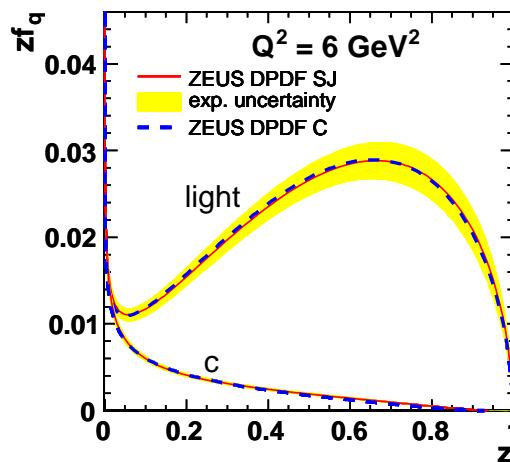

Check of the QCD fits dependence on the flavour treatment

# Diffractive PDF fits

Diffractive PDFs extracted from inclusive and jets cross sections in diffractive

ZEUS

Good description of the data obtained also for data not included in the fit (here dijets in PHP, also in the low  $x_\gamma$  region). No factorisation breaking.

# Jet algorithms

Jet reconstruction relies on **jet algorithms**.

Jet algorithms should not be sensitive to soft particle emission (**infrared safe**) and collinear particle splitting (**collinear safe**).

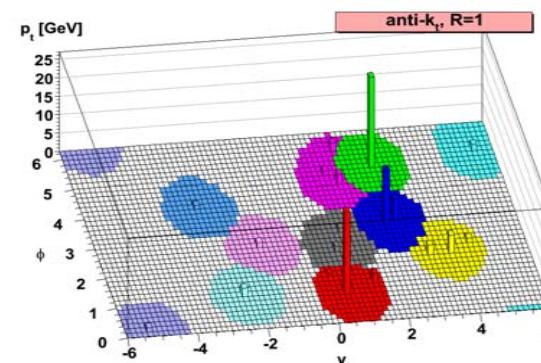

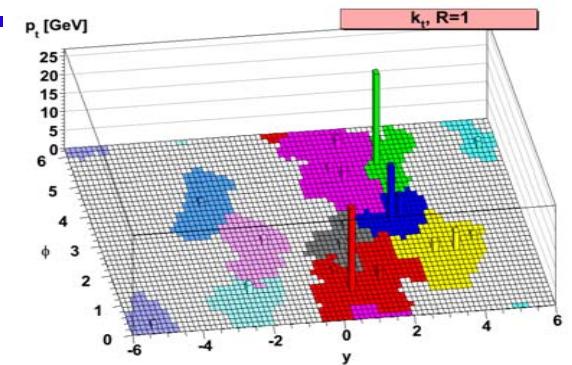

Cone algorithms normally used in hadron-hadron collisions are **not safe at all** order in QCD.

Example test on the same MC event:

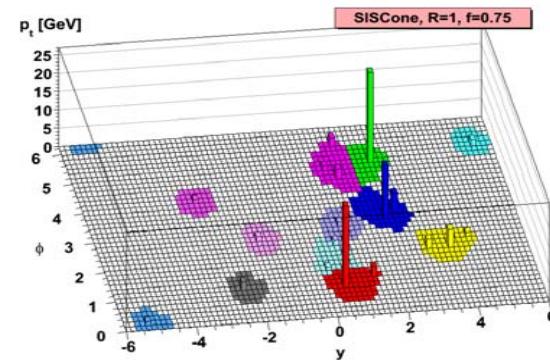

Anti- $k_T$  is similar to  $k_T$  but gives jets of regular shape, as SIScone (good i.e. for detector calibration).

Tested on data for the first time at ZEUS...

$k_T$  (Catani et al.)

New developments:  
anti- $k_T$  (Cacciari,  
Salam, Soyez 08)

SISCONE  
(Salam, Soyez 07)  
both safe at all  
orders

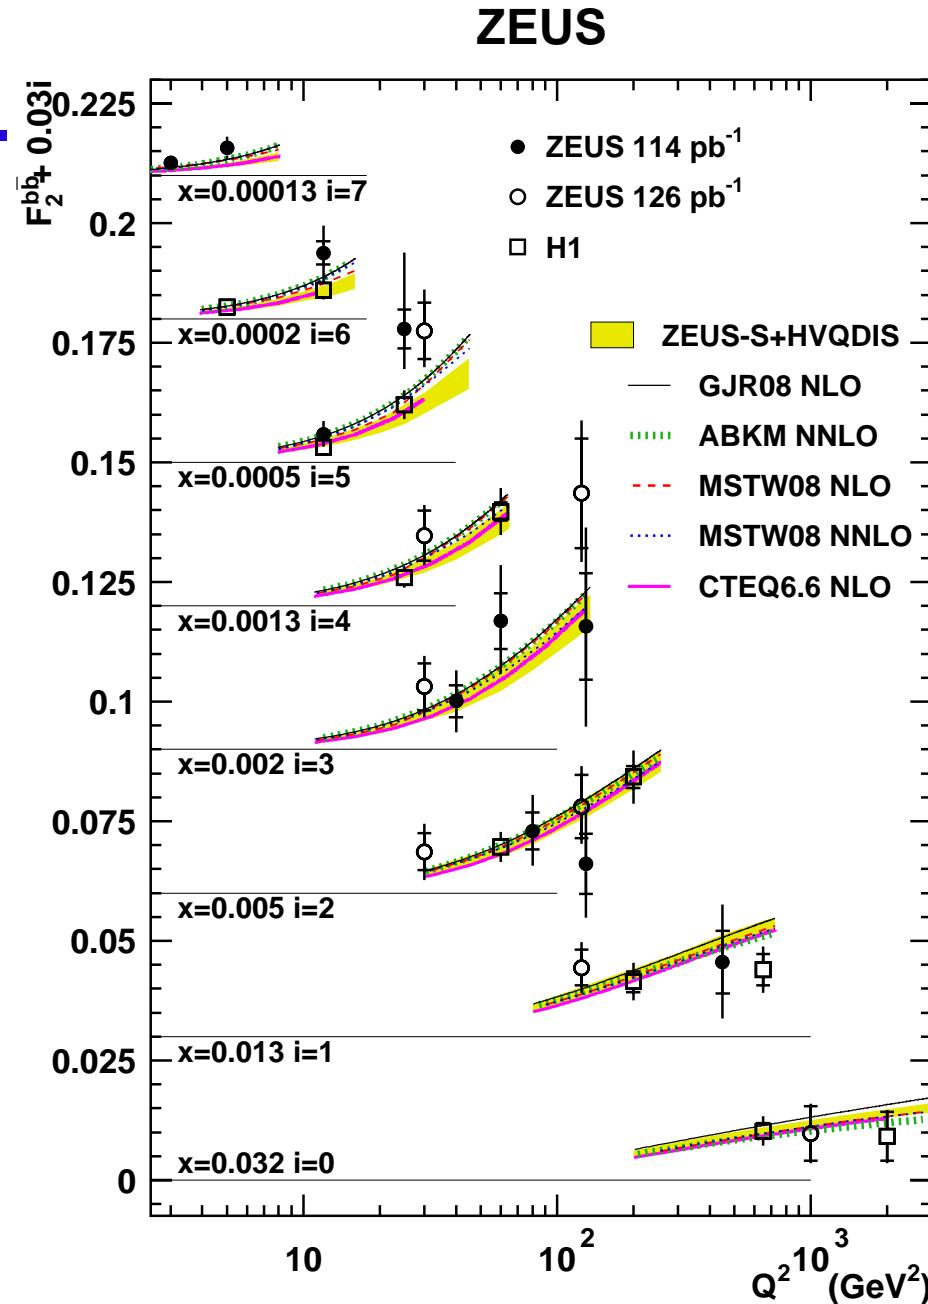

# ZEUS $F_2^b$

Present measurements based on events with muon and jets

Precision of the data is limited

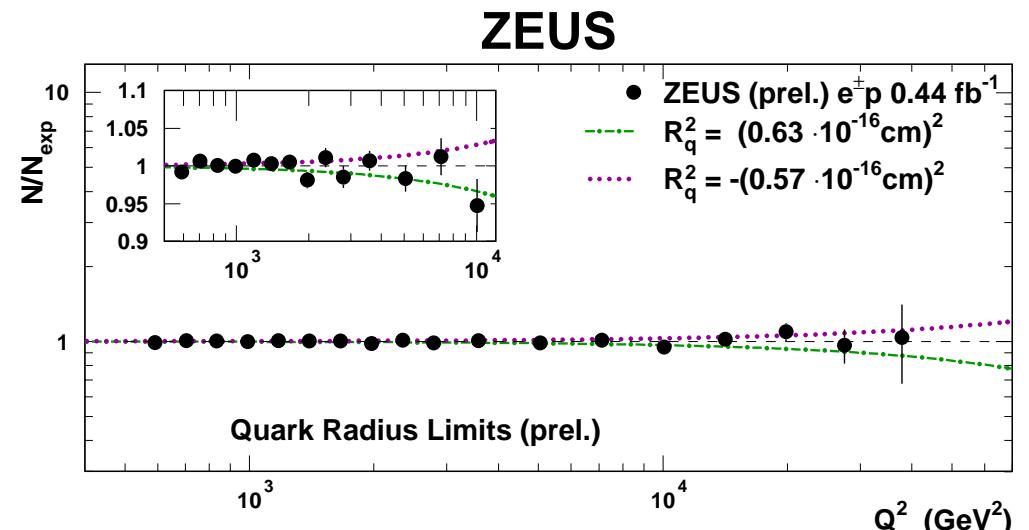

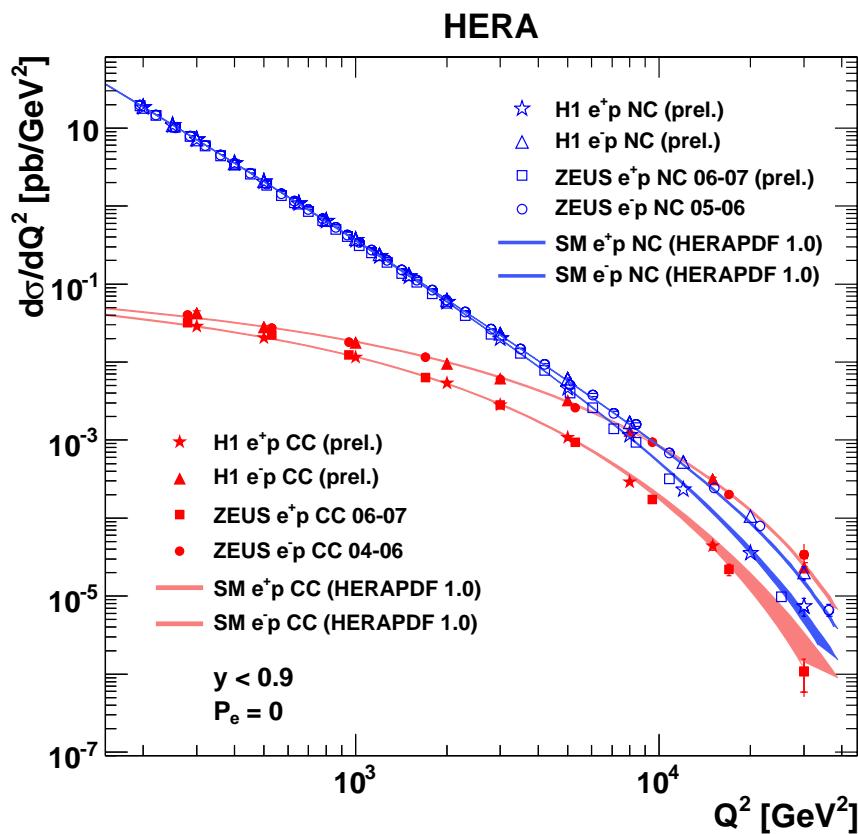

Will dramatically improved using jets from secondary vertices.

Fair agreement between the various theory predictions

# Quark radius, contact interactions

Full ZEUS NC statistics used to investigate quark radius, CI models, heavy leptoquarks, large extra dimensions. Strong limits extracted.

Limit on the quark radius:  
 $R < 0.63 \cdot 10^{-3} \text{ fm } @ 95\% \text{ CL}$

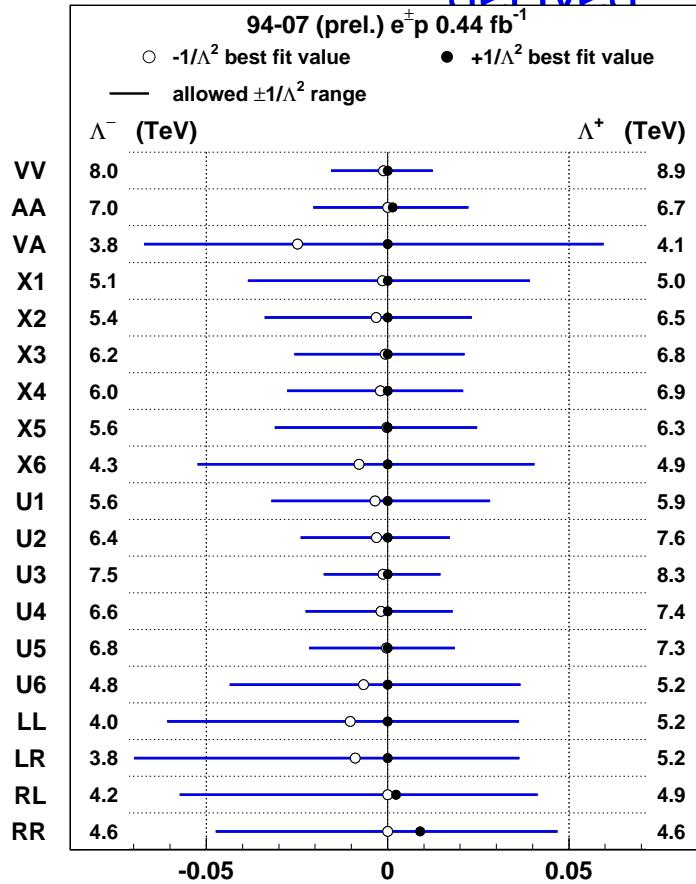

see Ilias Panagoulias [75]

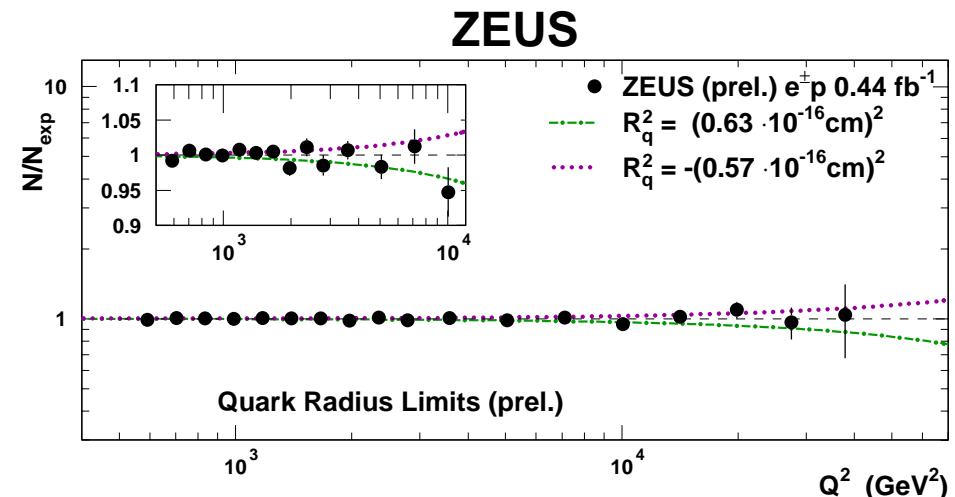

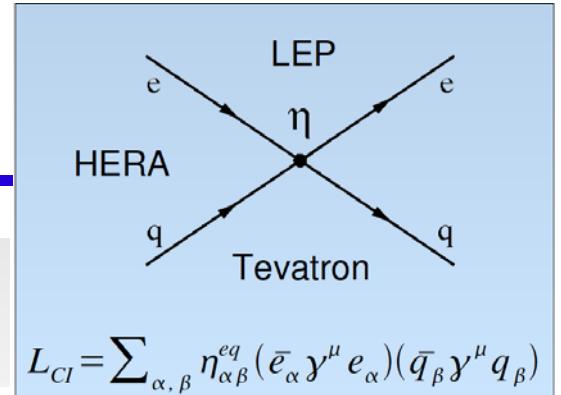

# Contact interactions, quark radius

Full ZEUS NC statistics used to investigate CI models. Strong limits on the couplings

ZEUS derived

$$\eta_{\alpha\beta}^{eq} = \frac{\epsilon g_{CI}^2}{\Lambda^2}$$

Limit on the quark radius:  
 $R < 0.63 \cdot 10^{-3} \text{ fm } @ 95\% CL$

ZEUS-prel-09-013

Andrea Parenti

69. PRC – Open session

35

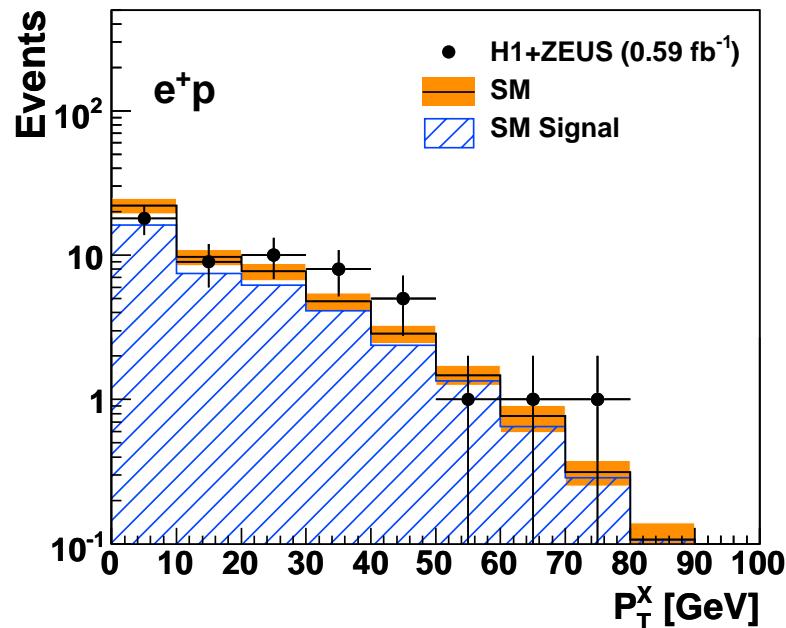

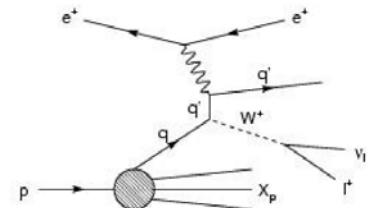

see David South[67]

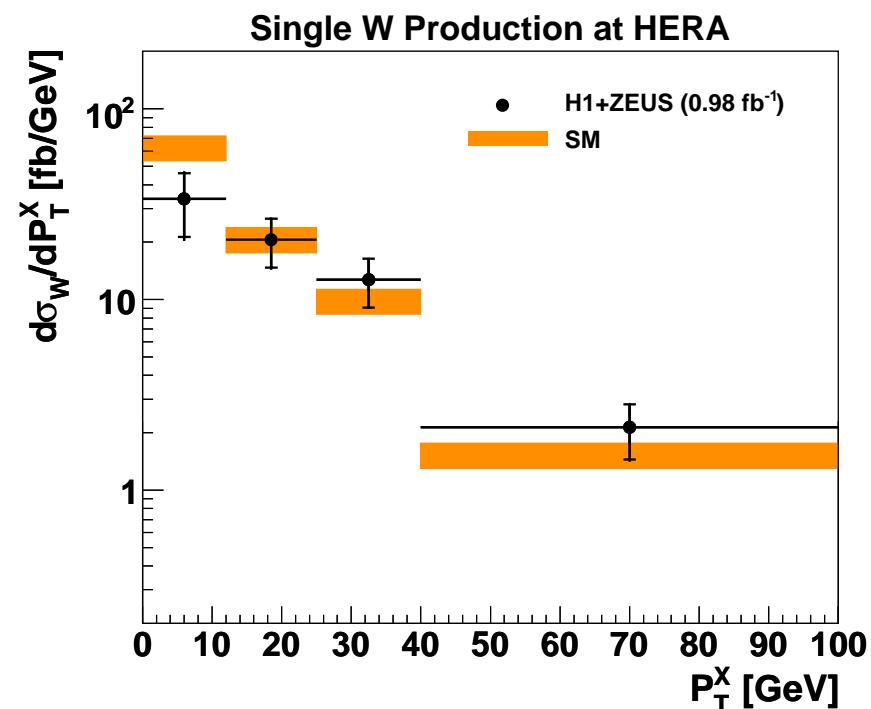

# Isolated leptons with missing $p_T$

Analysis based on the full ZEUS+H1 data sample,  $L=0.98$   $\text{fb}^{-1}$ . Dominant SM process:  $W$  production.

23 high- $p_T^X$  events in  $e^+p$  data,  
 $14 \pm 0.9$  predicted

$W$  production cross section measured

Andrea Parenti

69. PRC – Open session

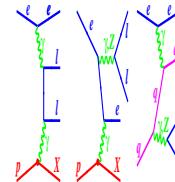

DESY-09-140

36

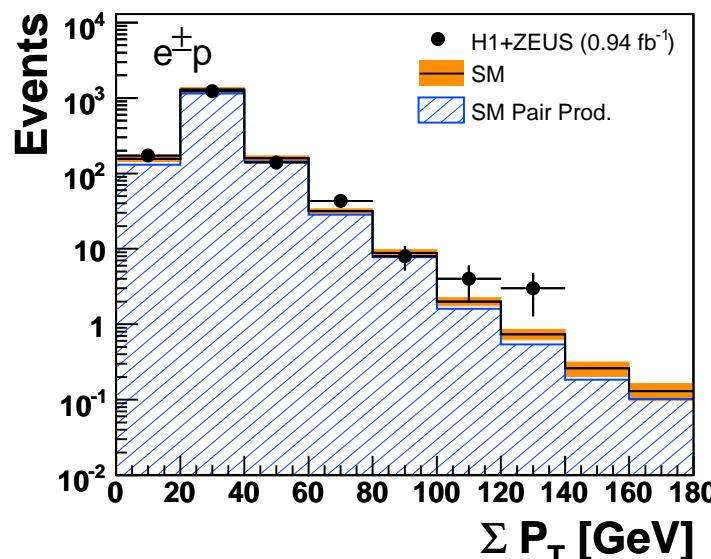

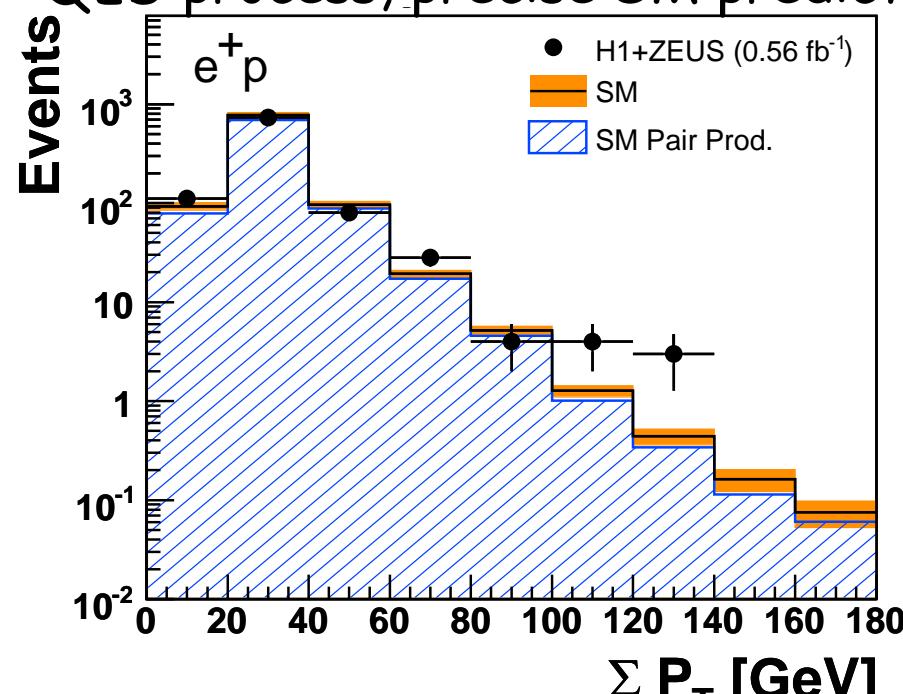

see Andrea Parenti [84]

# Multi-leptons

Analysis based on the full ZEUS+H1 data sample,  $L=0.94 \text{ fb}^{-1}$   
QED process, precise SM predictions  $\rightarrow$  look for deviations.

7 high- $\sum p_T$  events  
observed in  $e^+ p$  data

Multi-Leptons at HERA (0.94  $\text{fb}^{-1}$ )

Data sample	Data	$\sum P_T > 100 \text{ GeV}$		
		SM	Pair Production (GRAPE)	NC DIS + QEDC
$e^+ p$ (0.56 $\text{fb}^{-1}$ )	7	$1.94 \pm 0.17$	$1.52 \pm 0.14$	$0.42 \pm 0.07$
$e^- p$ (0.38 $\text{fb}^{-1}$ )	0	$1.19 \pm 0.12$	$0.90 \pm 0.10$	$0.29 \pm 0.05$
All (0.94 $\text{fb}^{-1}$ )	7	$3.13 \pm 0.26$	$2.42 \pm 0.21$	$0.71 \pm 0.10$

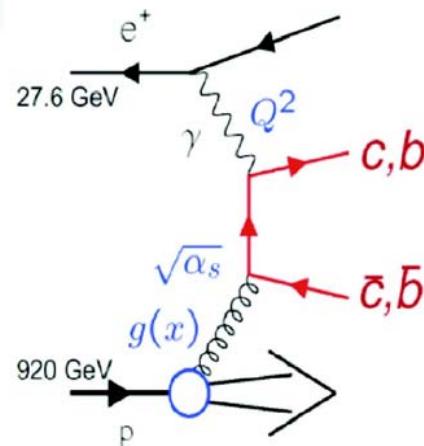

see Karin Daum [30]

# H1 + ZEUS $F_2^{cc}$

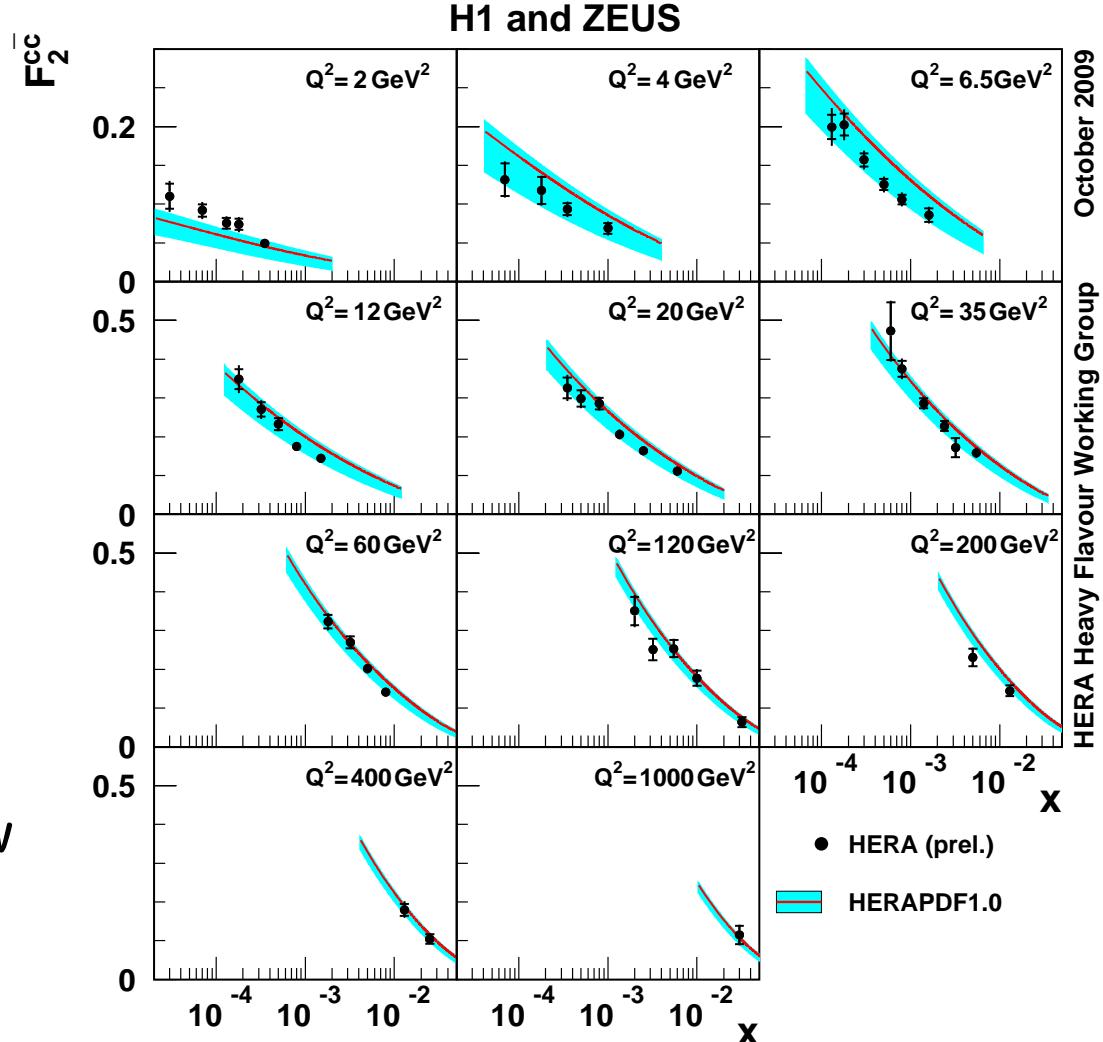

Sensitivity to the gluon.

Data from H1 and ZEUS combined.

Precision is now 5-10%.

Can be improved by adding new measurements (see comparison with new D<sup>+</sup> data)

Andrea Parenti

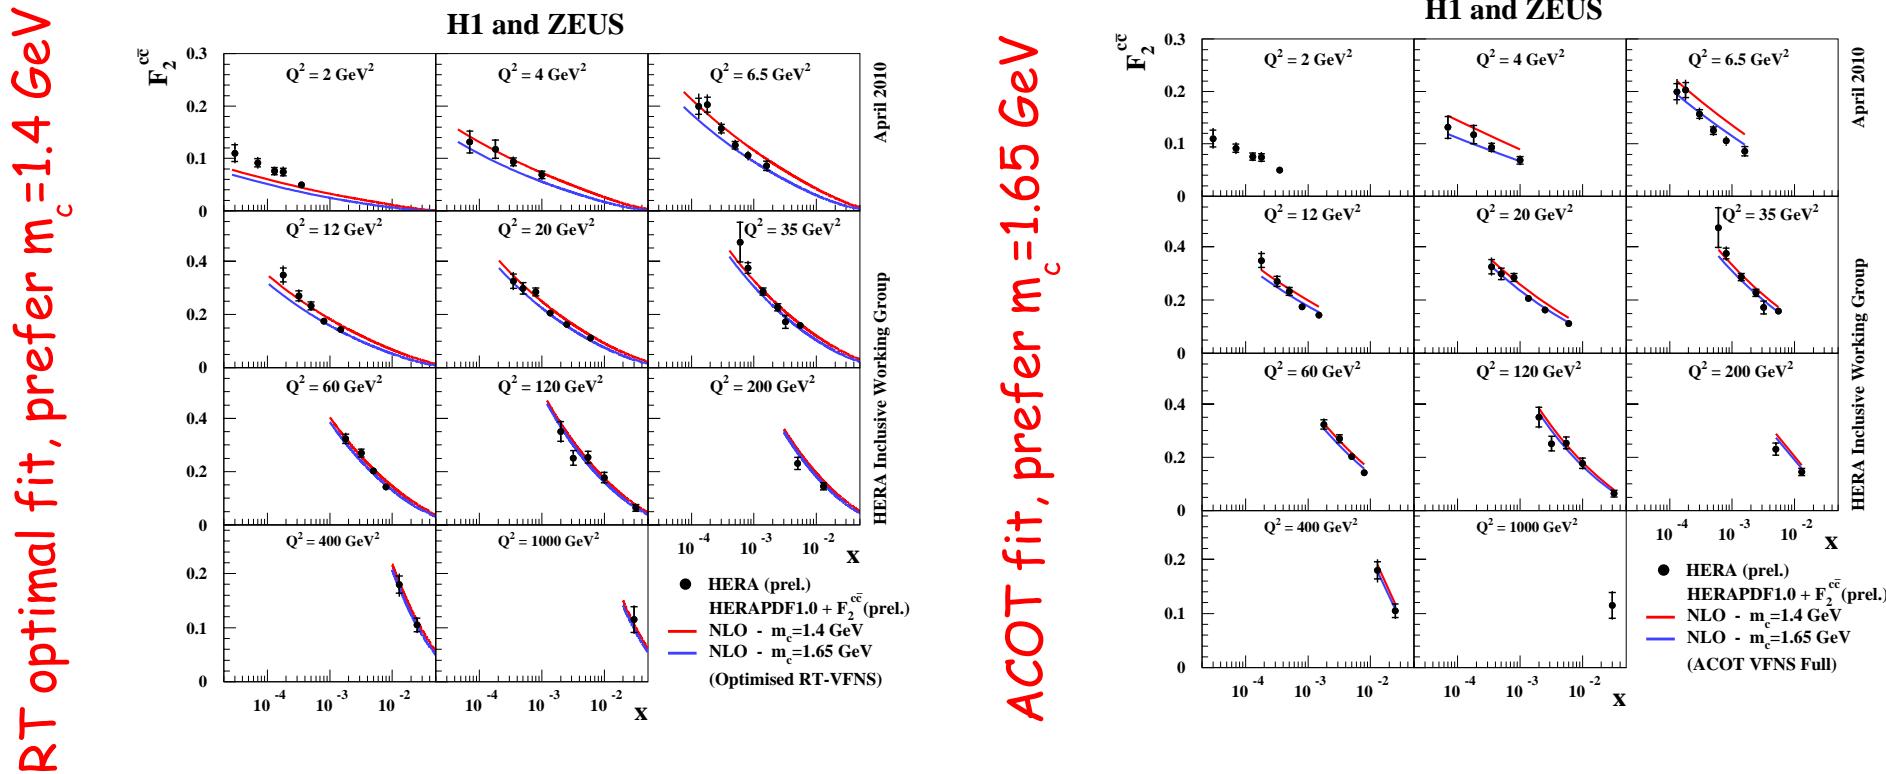

see Amanda Cooper-Sarkar [31]

# QCD fits with charm data

New  $F_2^c$  data added to the HERAPDF1.0 fit. PDF and  $\chi^2$  do not change much.

But the fits are very sensitive to the charm mass and to the heavy quark treatment. Different approaches prefer different masses.

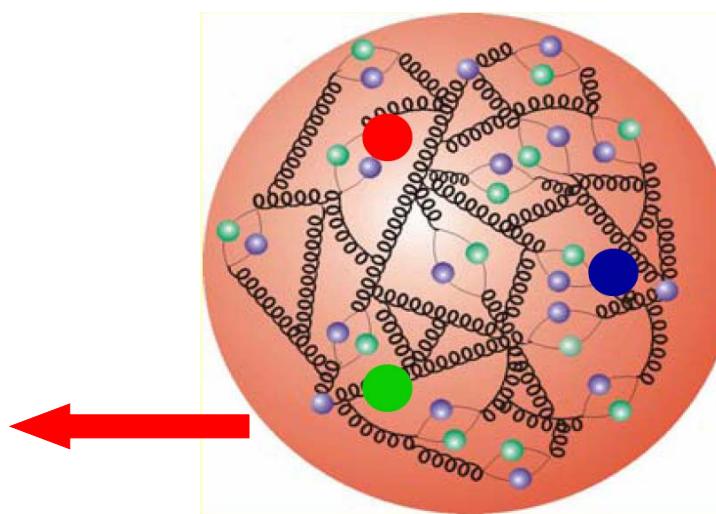

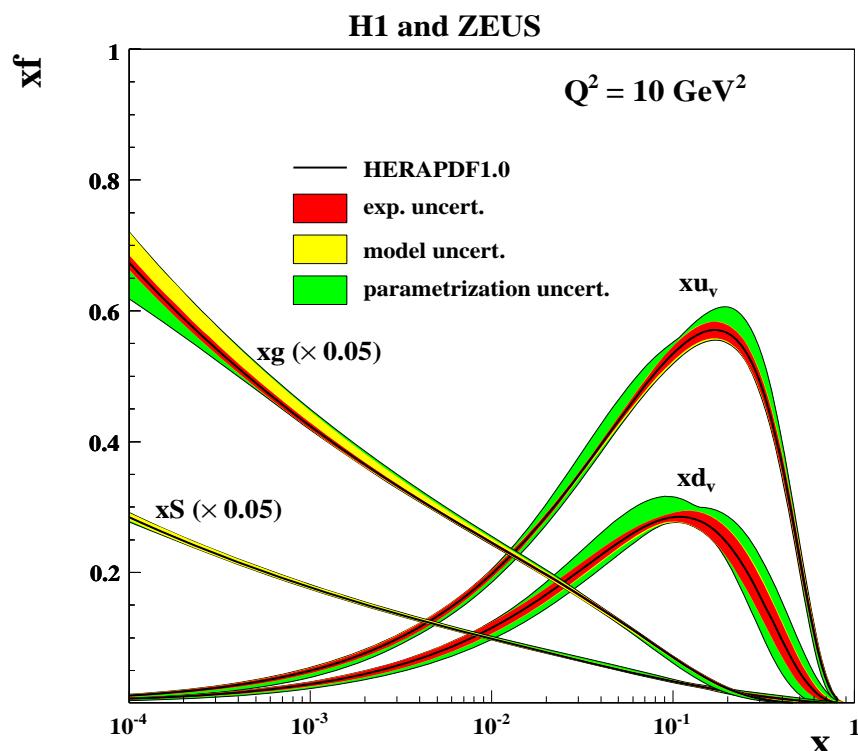

The choice of the mass plays an important role for predictions at LHC!

Andrea Parenti

# HERAPDF1.0

The combined HERA data have been used as the sole input for the extraction of the HERAPDF1.0.

Gluon (and sea) scaled down by a factor 20, dominate at low  $x$ .

JHEP01(2010)109

Precise picture of the proton
