

# **Analysis of the process $e^+e^- \rightarrow H_iH_j \rightarrow b\bar{b}b\bar{b}$ at TESLA**

Tatsiana Klimkovich

DESY, Hamburg

# TESLA

Future  $e^+e^-$  Linear Collider

Luminosity:  $500 fb^{-1}$

$\sqrt{s} = 500 \text{ GeV}$

## Contents:

- MSSM scenario
- Analysis of the process  
 $e^+e^- \rightarrow H_i H_j \rightarrow b\bar{b}b\bar{b}$
- Higgs mass reconstruction:
  - Applied cuts
  - Energy rescaling
  - Kinematic fit
- Scan over the Higgs mass grid
- Indirect measurement of parameters of CP-violating MSSM scenario

# MSSM

## CP-Conserving Scenario:

5 physical Higgs Bosons:

2 neutral CP-even:  $H^0, h^0$

1 neutral CP-odd:  $A^0$

2 charged:  $H^+, H^-$

**mass eigenstates = CP eigenstates**

## CP-Violating Scenario:

3 neutral Higgs Bosons:

$H_1, H_2, H_3$

$M_{H_1} \leq M_{H_2} \leq M_{H_3}$

have mixed CP parities

**mass eigenstates  $\neq$  CP eigenstates**

## CP-Violation:

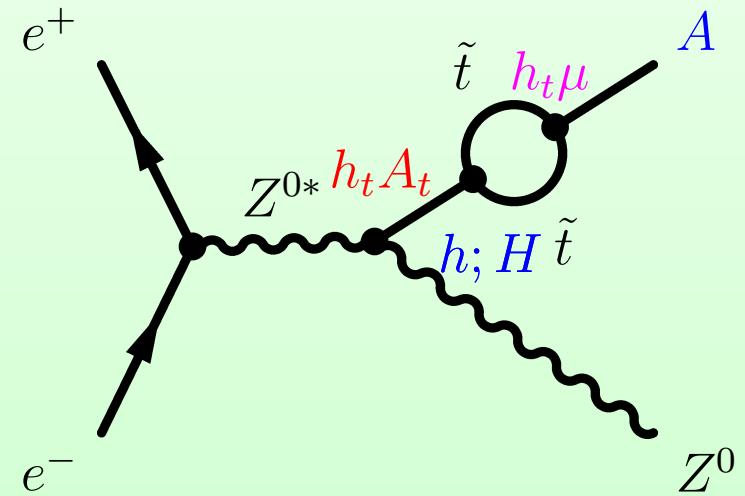

$A_{t,b}$  - Complex

$m_{\tilde{g}}$  - Complex

$A_{t,b}$  - soft SUSY-breaking trilinear coupling of the Higgs boson to top (bottom) squarks.

$h_{t,b}$  - Yukawa couplings.

## Higgsstrahlung:

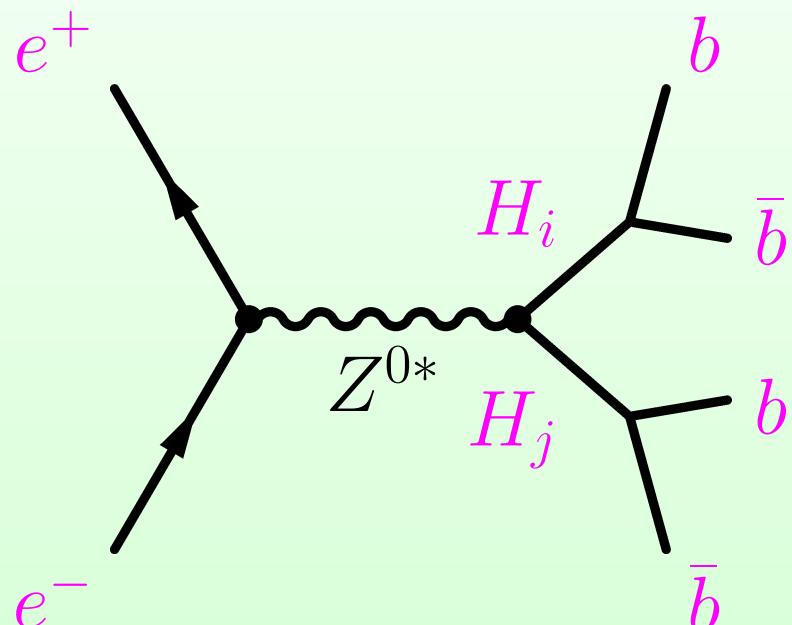

## Parametrization of the Higgs sector:

$$M_{H^+} \quad \text{and} \quad \tan\beta = \frac{v_2}{v_1}$$

**TESLA**

$$e^+ e^- \rightarrow H_i H_j \rightarrow b\bar{b} b\bar{b}$$

Using:

$$\sqrt{s} = 500 \text{ GeV}$$

$$L = 500 \text{ fb}^{-1}$$

- HZHA (from ALEPH): generation
- SIMDET 4.01: fast simulation
- ZV-TOP (from SLD): b-tagging
- Kinematic Fit (from DELPHI)

$$(\sigma * BR) - ?$$

$$M_{H_i} - ? \quad M_{H_j} - ?$$

# Analysis of $e^+e^- \rightarrow H_2H_3 \rightarrow b\bar{b}b\bar{b}$ at TESLA.

**Signal (example point):**

Parameter	Value
$\tan \beta$	<b>19</b>
$M_{H^+}$	<b>164 GeV</b>
$Re(A_t)$	<b>285 GeV</b>
$Im(A_t)$	<b>771 GeV</b>

$$M_{H_1} = 112.0 \text{ GeV}$$

$$M_{H_2} = 140.5 \text{ GeV}$$

$$M_{H_3} = 154.7 \text{ GeV}$$

$$N_{events}(H_2H_3 \rightarrow b\bar{b}b\bar{b}) = 6305$$

**Background: 9.4 million events**

**Signal and BG samples:**

Process	$\sigma$ [fb]
$H_1H_2 \rightarrow b\bar{b}b\bar{b}$	<b>0.4196</b>
$H_2H_3 \rightarrow b\bar{b}b\bar{b}$	<b>12.61</b>
$H_1H_3 \rightarrow b\bar{b}b\bar{b}$	<b>3.428</b>
$Z^0\gamma^* \rightarrow 2q$	<b>13580</b>
$W^+W^- \rightarrow 4q$	<b>4134</b>
$Z^0Z^0 \rightarrow 4q$	<b>314.3</b>
$H_1Z^0 \rightarrow b\bar{b}q\bar{q}$	<b>34.63</b>
$H_2Z^0 \rightarrow b\bar{b}q\bar{q}$	<b>6.043</b>
$t\bar{t} \rightarrow W^+W^-b\bar{b}$	<b>669.3</b>

# Cuts

## Against 2-fermion background:

- Hadronic 4-jet events with full energy

## Against 4-fermion background:

- Nonforward peaked and spherical events

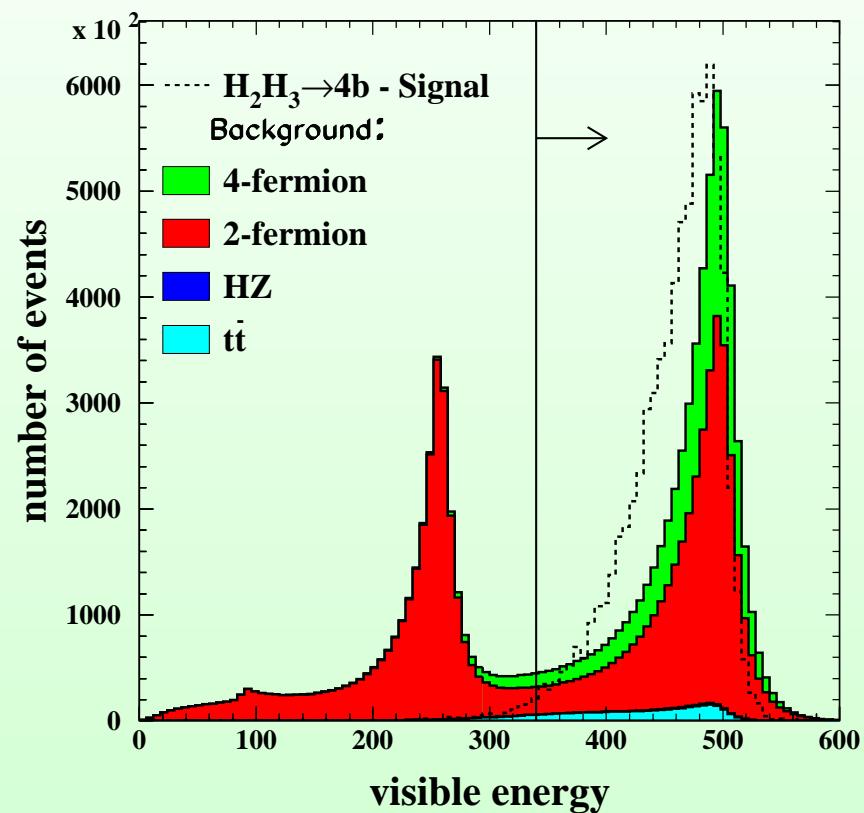

## For $t\bar{t}$ background reduction:

- Number of tracks and clusters cut
- Jet resolution parameter cut

## Against light flavour quarks:

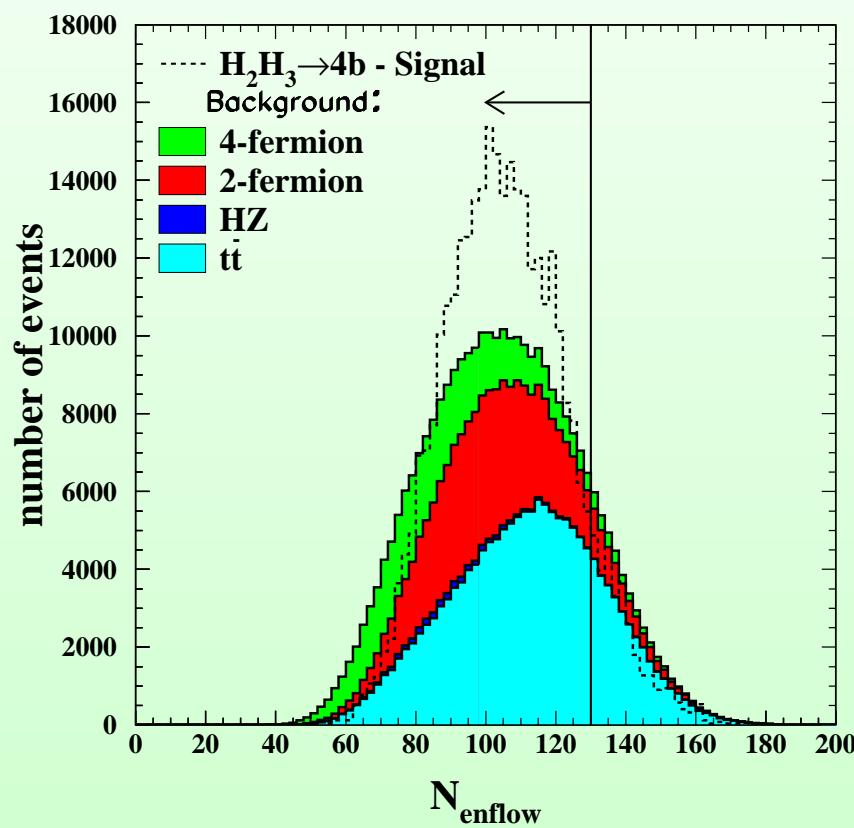

- b-Tag

## Visible energy cut

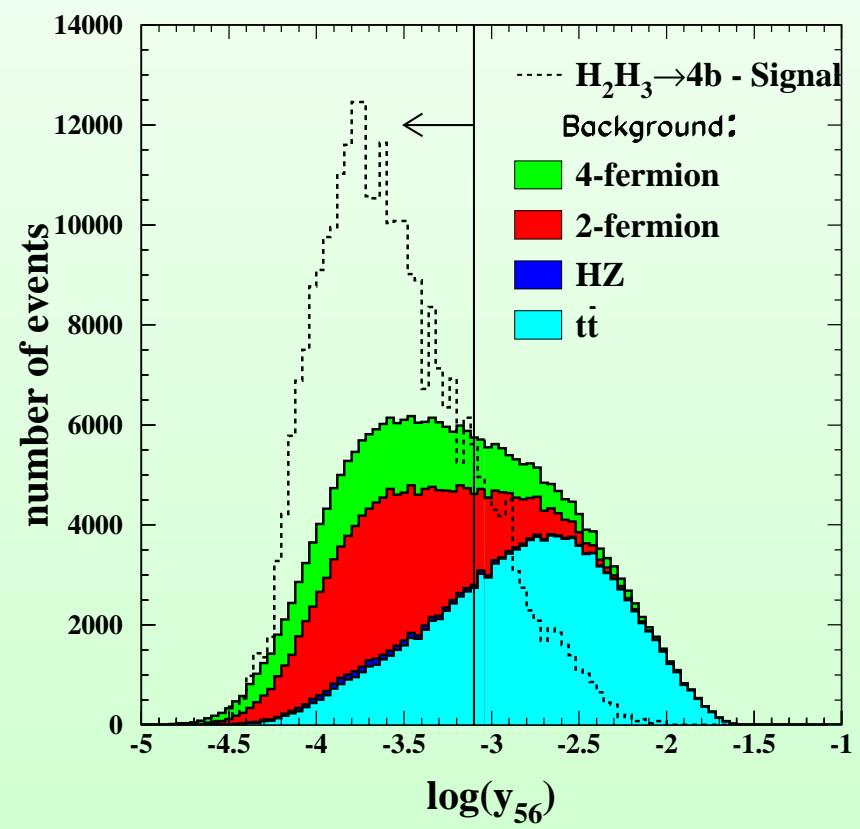

## Cuts against $t\bar{t}$ background

Number of "enflow" objects cut

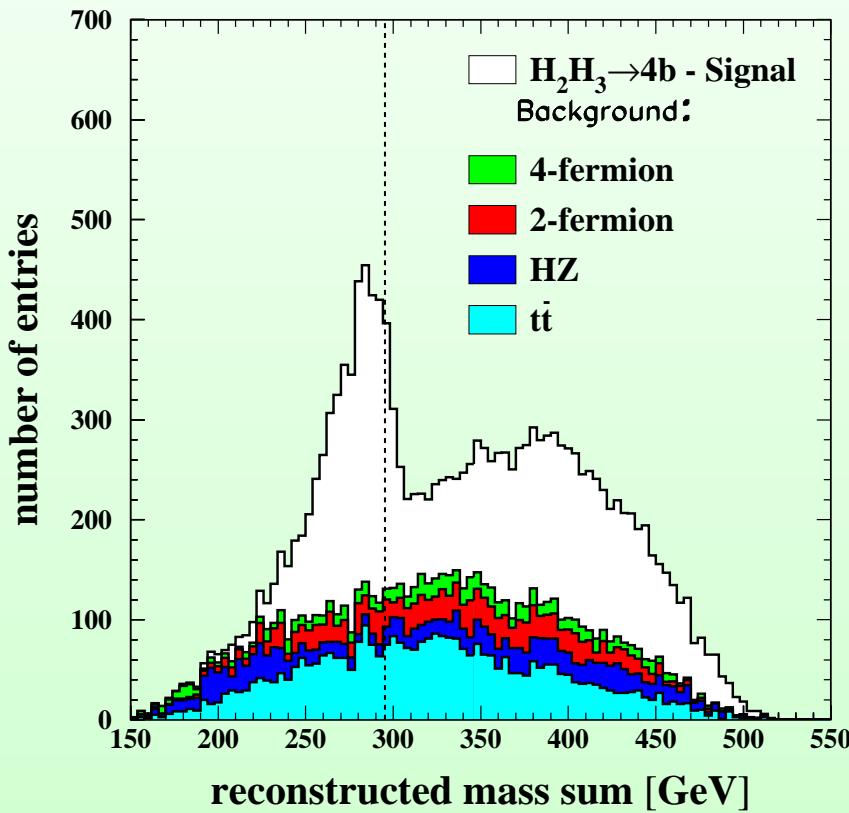

Jet resolution parameter cut

# Cuts

## Reconstructed Mass Sum after Cuts

3 combinations of 4 jets for 2 masses

## Cutflow

Cut	Signal	Eff.	Total BG
no cuts	6305	100.0	9401167
$N_{jets}$	6305	100.0	9330067
$P_{vis}$	6247	99.1	6055178
$N_{tr}/jet$	5943	94.3	2692089
$\cos(thrust)$	5549	88.0	1371713
$thrust$	5189	82.3	339074
$\log(y_{34})$	5074	80.5	309670
$N_{eflow}$	4608	73.1	268184
$\log(y_{56})$	3853	61.1	150522
$B_{12}$	3777	59.9	43905
$B_{34}$	3042	48.3	2485

## Mass reconstruction improvement

The reconstructed mass sum is shifted:

Missing energy from decay neutrinos.

⇒ Energy rescaling:

$$E_{jet}, \vec{p}_{jet} * \frac{\sqrt{s}}{E_{vis}}$$

⇒ Kinematic Fit:

Use of constraints.

$$4cfit : \left\{ \begin{array}{l} \sum E_i = \sqrt{s} \\ \sum p_{xi} = 0 \\ \sum p_{yi} = 0 \\ \sum p_{zi} = 0 \end{array} \right.$$

**Kinematic fit:**

$$Q(\vec{y}, \vec{\lambda}) = (\vec{y} - \vec{y}_0)^T V^{-1} (\vec{y} - \vec{y}_0) + 2\vec{\lambda} \vec{f}(\vec{y})$$

$\vec{f}(\vec{y})$  - constraints

$\vec{y}$  - jet parameters

$\vec{\lambda}$  - Lagrange multipliers

$V$  - error matrix

**Error matrix: resolution functions**

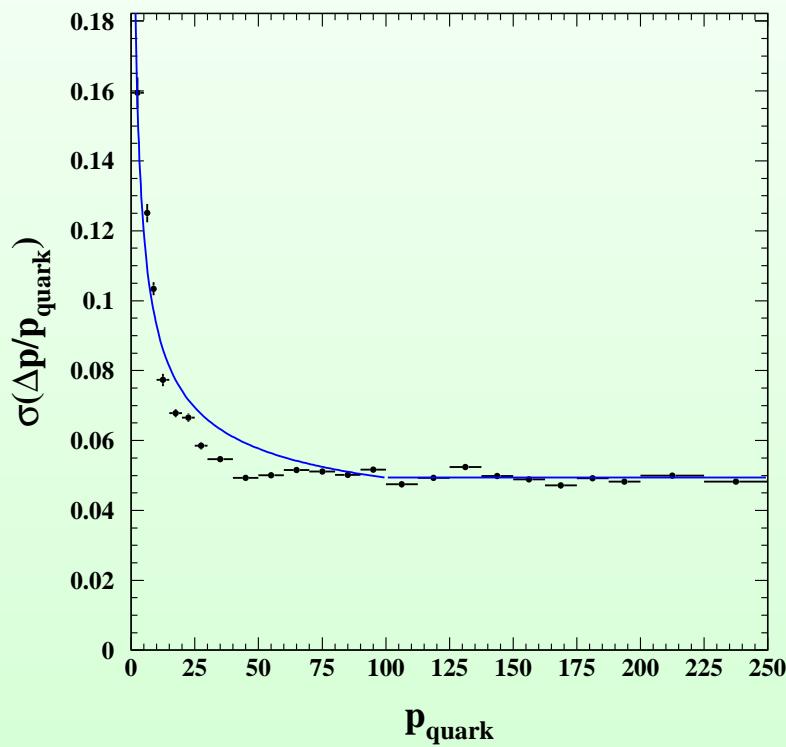

$$\sigma\left(\frac{p_{quark} - p_{jet}}{p_{quark}}\right)(p_{quark})$$

$$\sigma(\phi_{quark} - \phi_{jet})(p_{quark})$$

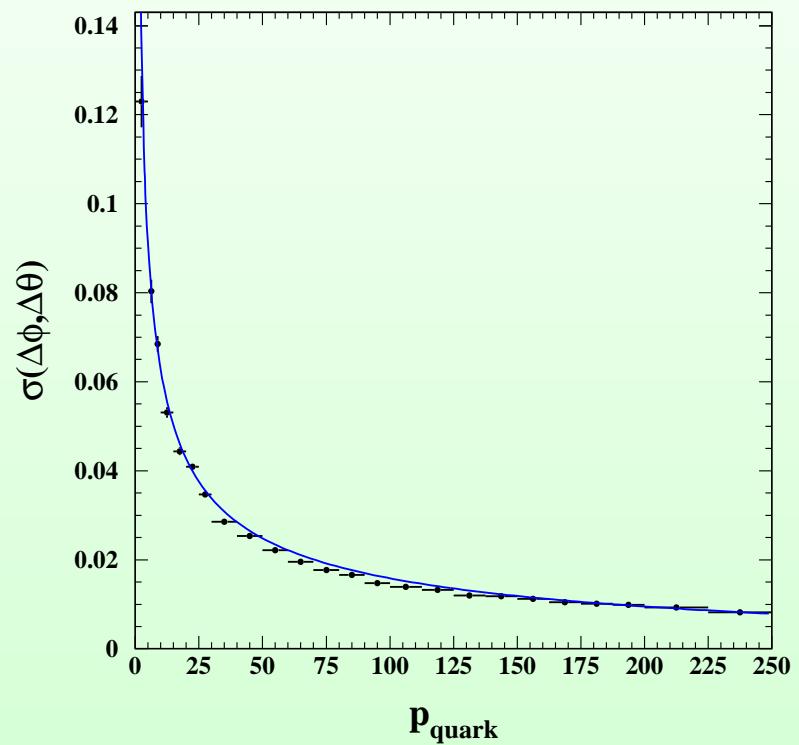

$$\sigma(\theta_{quark} - \theta_{jet})(p_{quark})$$

# Resolution functions

## Momentum resolution

## Angular resolution

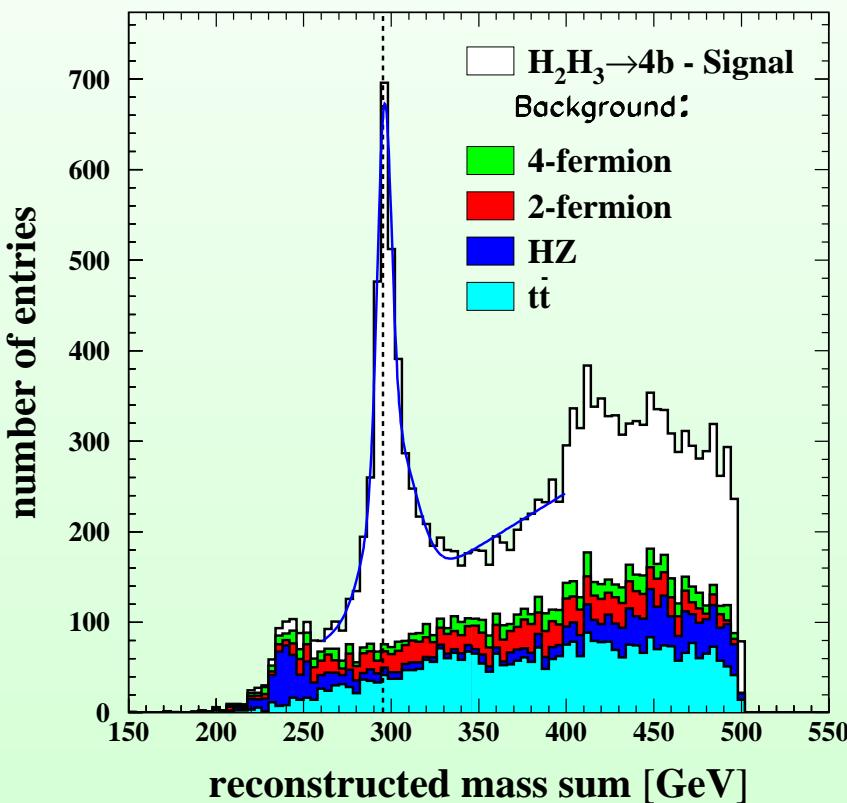

$$\sigma\left(\frac{\Delta p}{p_{\text{quark}}}\right) = \begin{cases} 0.03 + \frac{0.20}{\sqrt{p_{\text{quark}}}}, & p_{\text{quark}} < 100\text{GeV} \\ 0.05, & p_{\text{quark}} \geq 100\text{GeV} \end{cases}$$

$$\sigma(\Delta\phi, \Delta\theta) = -0.01 + \frac{0.21}{\sqrt{p_{\text{quark}}}}$$

## Mass reconstruction after fit

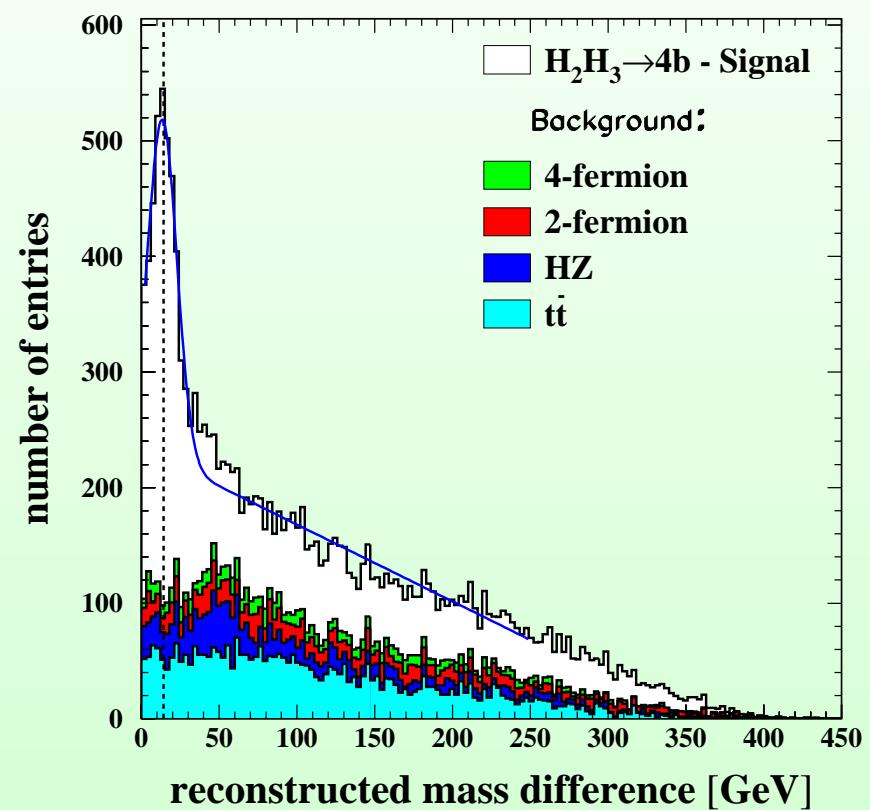

**Reconstructed Mass Sum**

$$\Sigma M = (296.1 \pm 0.3) \text{ GeV}$$

$$\text{Width} = (4.0 \pm 0.5) \text{ GeV}$$

**Reconstructed Mass Difference**

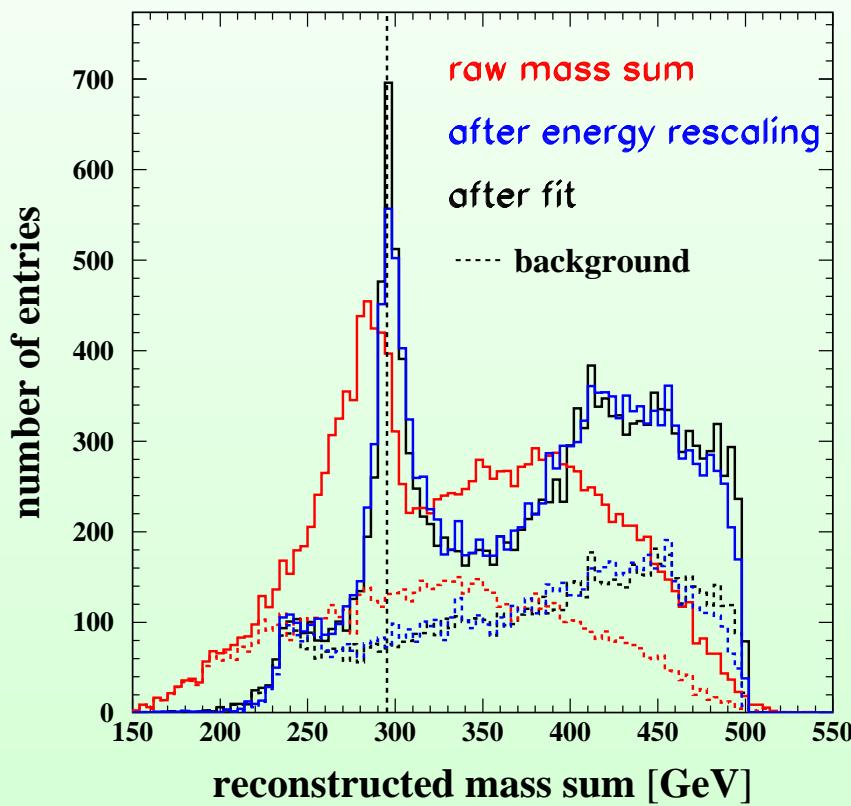

$$\Delta M = (13.5 \pm 0.4) \text{ GeV}$$

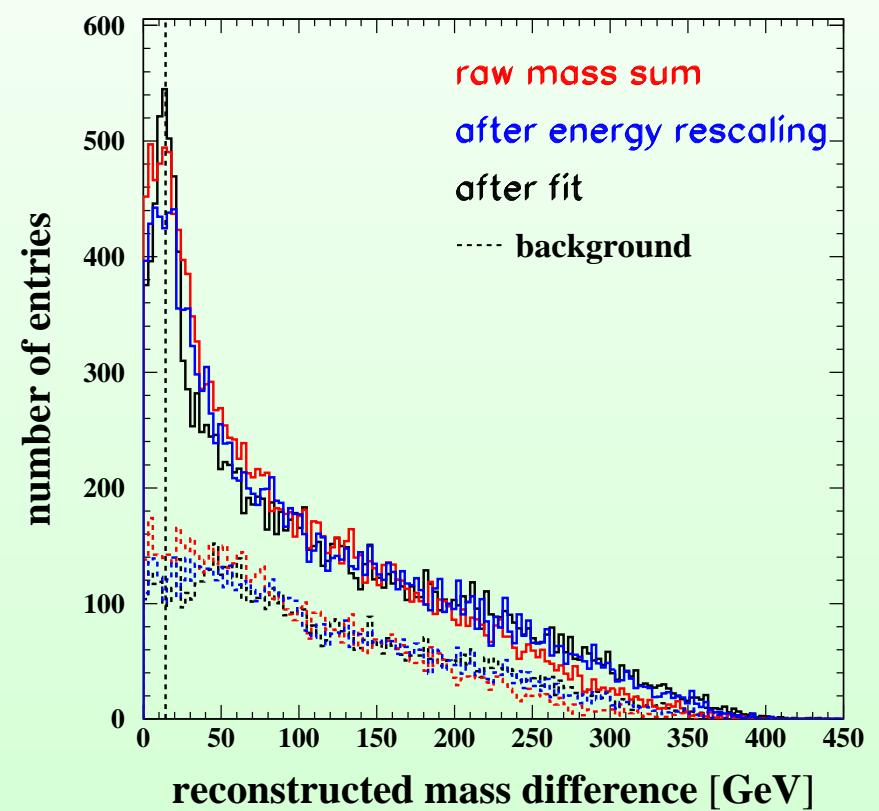

$$\text{Width} = (9.3 \pm 0.6) \text{ GeV}$$

# Improved mass reconstruction

$$\sqrt{s} = 500 \text{ GeV}$$

$$L = 500 \text{ } fb^{-1}$$

$$\text{BR}(H \rightarrow b\bar{b}) = 0.85$$

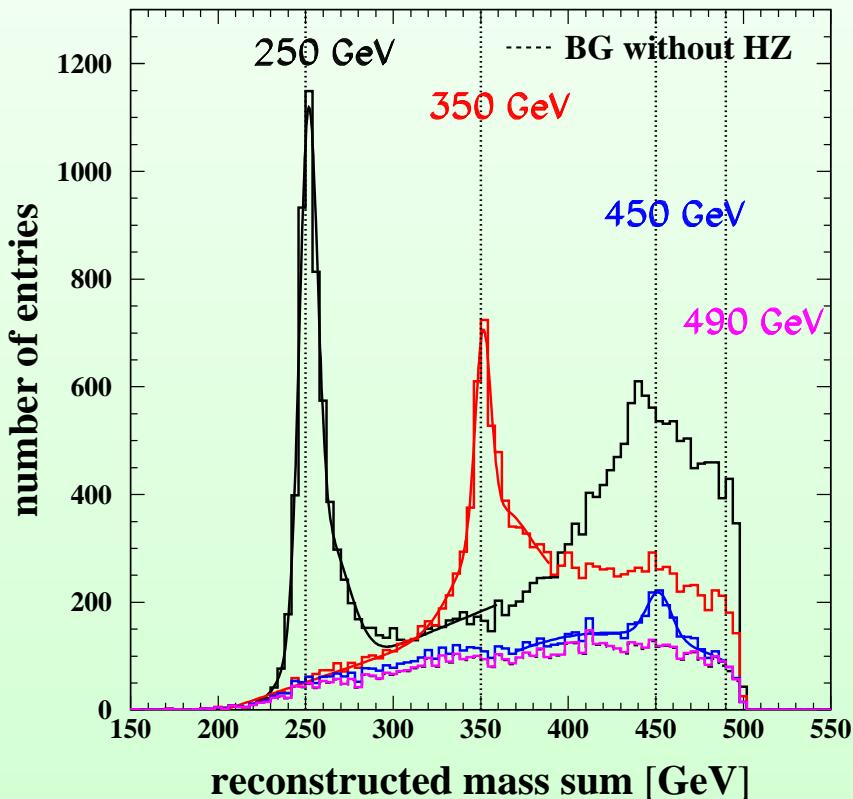

$$\sin^2(\beta - \alpha) = 1$$

Cross section relative error:

$$\frac{\sqrt{N_{Signal} + N_{BG}}}{N_{Signal}}$$

## Mass grid

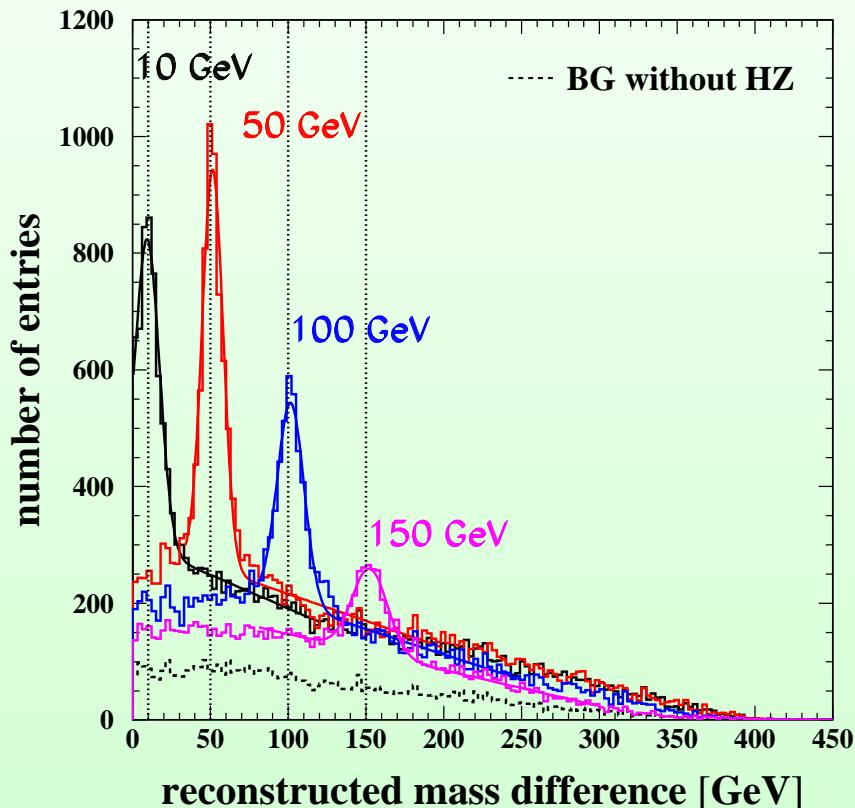

### Reconstructed Mass Sum

$\Sigma M_{point}$	$\Sigma M_{rec}$ [GeV]	Width [GeV]
250	$251.52 \pm 0.18$	5.11
(295)	$296.10 \pm 0.30$	4.00
350	$351.31 \pm 0.30$	4.43
450	$451.70 \pm 0.92$	7.11

## Mass grid

### Reconstructed Mass Difference

$\Delta M_{point}$	$\Delta M_{rec}$ [GeV]	Width [GeV]
10	$9.37 \pm 0.31$	7.91
50	$51.42 \pm 0.17$	6.73
100	$101.57 \pm 0.30$	8.65
150	$152.42 \pm 0.59$	11.51

# Measurement of parameters of CP-violating MSSM scenario

**CP-Violating Scenario:**

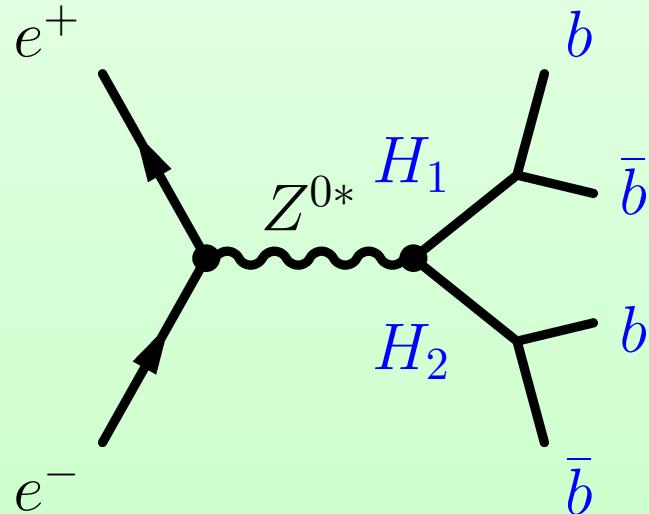

$A_{t,b}$  - Complex

$m_{\tilde{g}}$  - Complex

We measured:  $\sigma * BR, \Sigma M, \Delta M$

$\Rightarrow$  We know:  $\sigma * BR$   $M_{H_i}$   $M_{H_j}$

Example:

We know:

$$\sigma(e^+ e^- \rightarrow H_1 H_2) *$$

$$BR(H_1 \rightarrow b\bar{b}) * BR(H_2 \rightarrow b\bar{b})$$

with precision 10 %

$$M_{H_1}, M_{H_2}$$

with precision 1 GeV

It is found:

we can measure  $\arg(A_{t,b})$

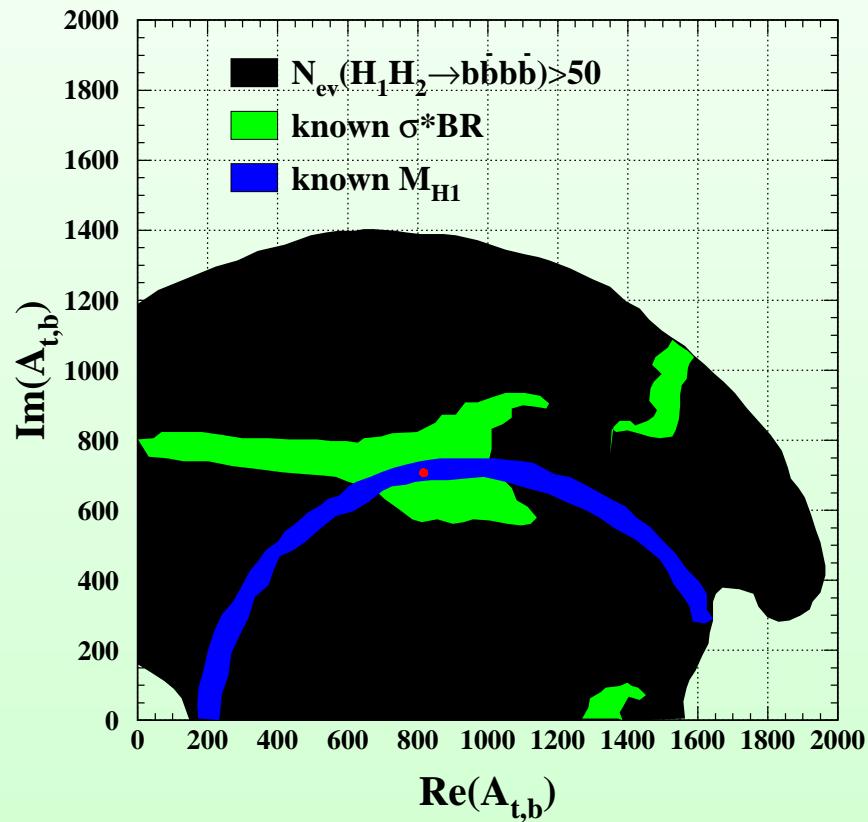

(indirect)

## 2-Parameter Scan

$$\sqrt{s} = 500 \text{ GeV} \quad L = 500 \text{ fb}^{-1}$$

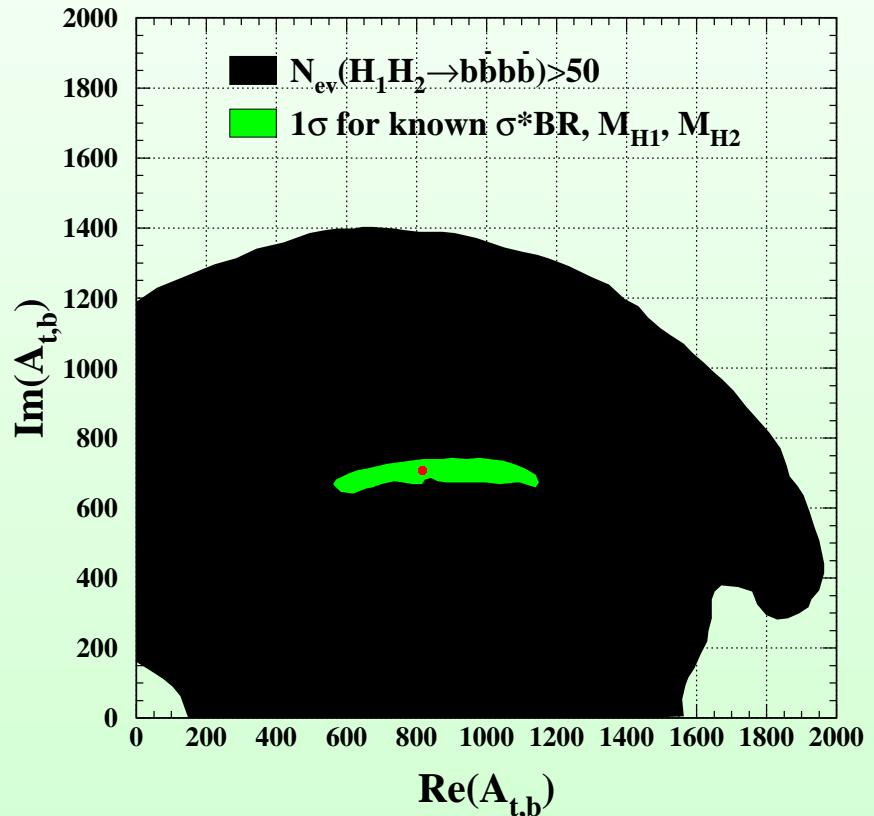

$$\tan \beta = 3 \quad M_{H^+} = 200 \text{ GeV}$$

We know:  $\sigma * BR, M_{H_1}$

Sensitivity:

We know:  $\sigma * BR, M_{H_1}, M_{H_2}$

$$Re(A_{t,b}) = (800 \pm 300) \text{ GeV}$$

$$Im(A_{t,b}) = (700 \pm 50) \text{ GeV}$$

## Summary

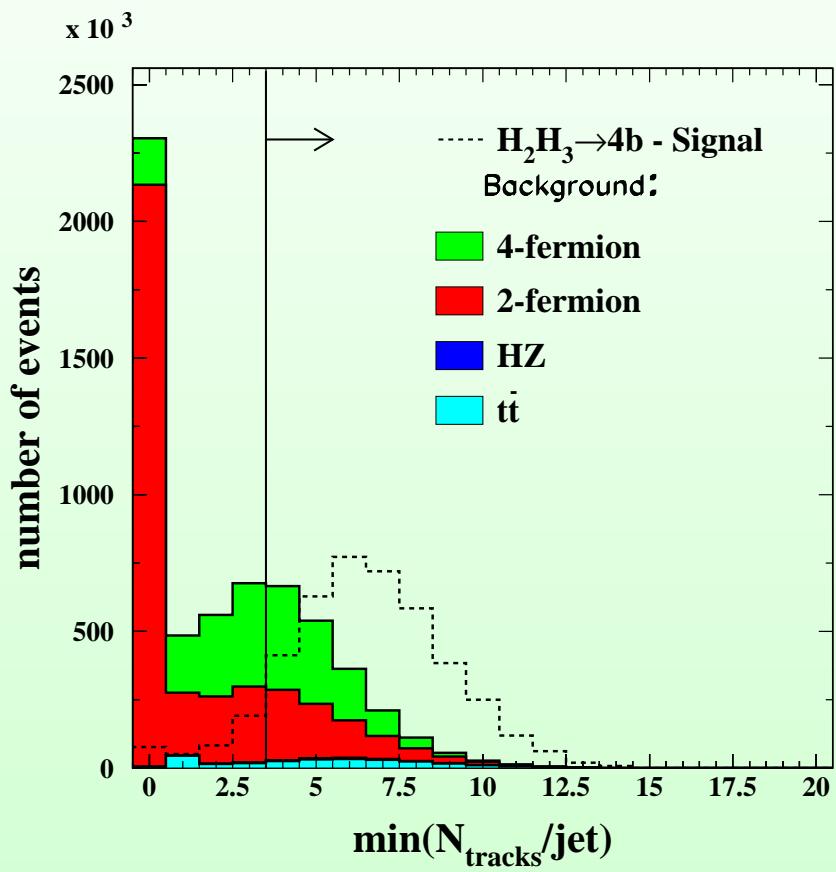

- Cut analysis for the process  $e^+ e^- \rightarrow H_i H_j \rightarrow b\bar{b} b\bar{b}$  at TESLA is made.
- Kinematic fit for the mass spectra is promising. Accuracy for the Higgs mass determination is several hundred MeV.
- Analysis is extended into the Higgs mass grid.
- Relative errors for the cross section are estimated.
- The prospects for CP-violating MSSM parameters measurements at TESLA are good.

## Outlook

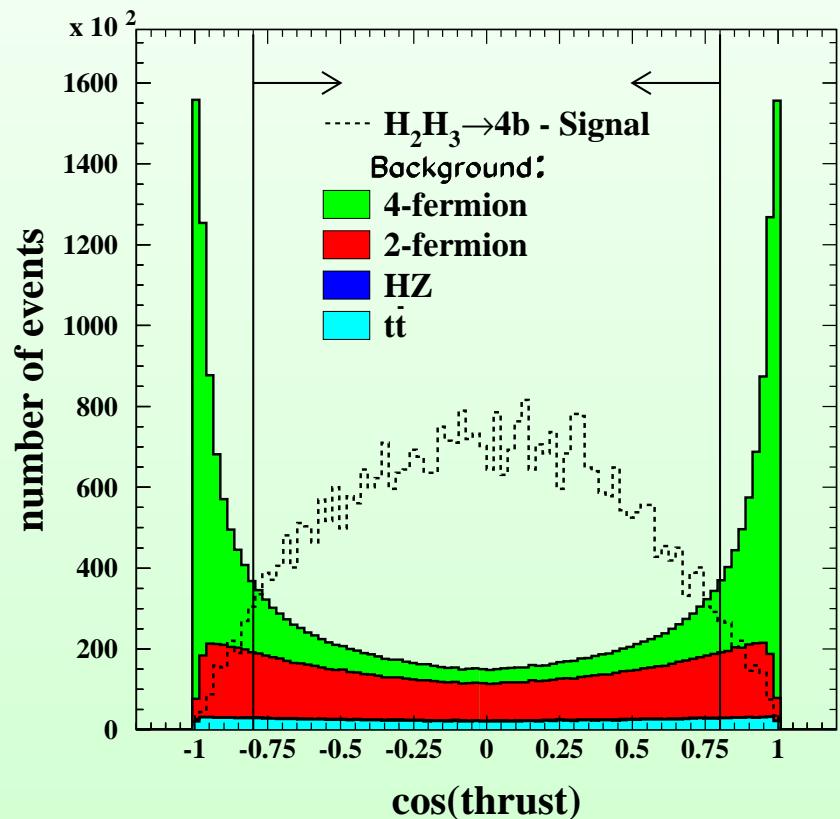

- **Analysis improvement:**
  - Implementation of the lepton veto against  $t\bar{t}$  background.
  - $s'$  tag.
  - Proper treatment of the HZ background for the mass grid.
- **Interpretation:**
  - Combined  $4b$ ,  $b\bar{b}\tau^+\tau^-$  and HZ analysis.
  - Interpretation for the Snowmass points in MSSM.
  - Analysis in the frame of CP-violating scenario.
  - Model independent interpretation.
