Physics Updates from **HERMES**

M. MURRAY, UNIVERSITY OF GLASGOW

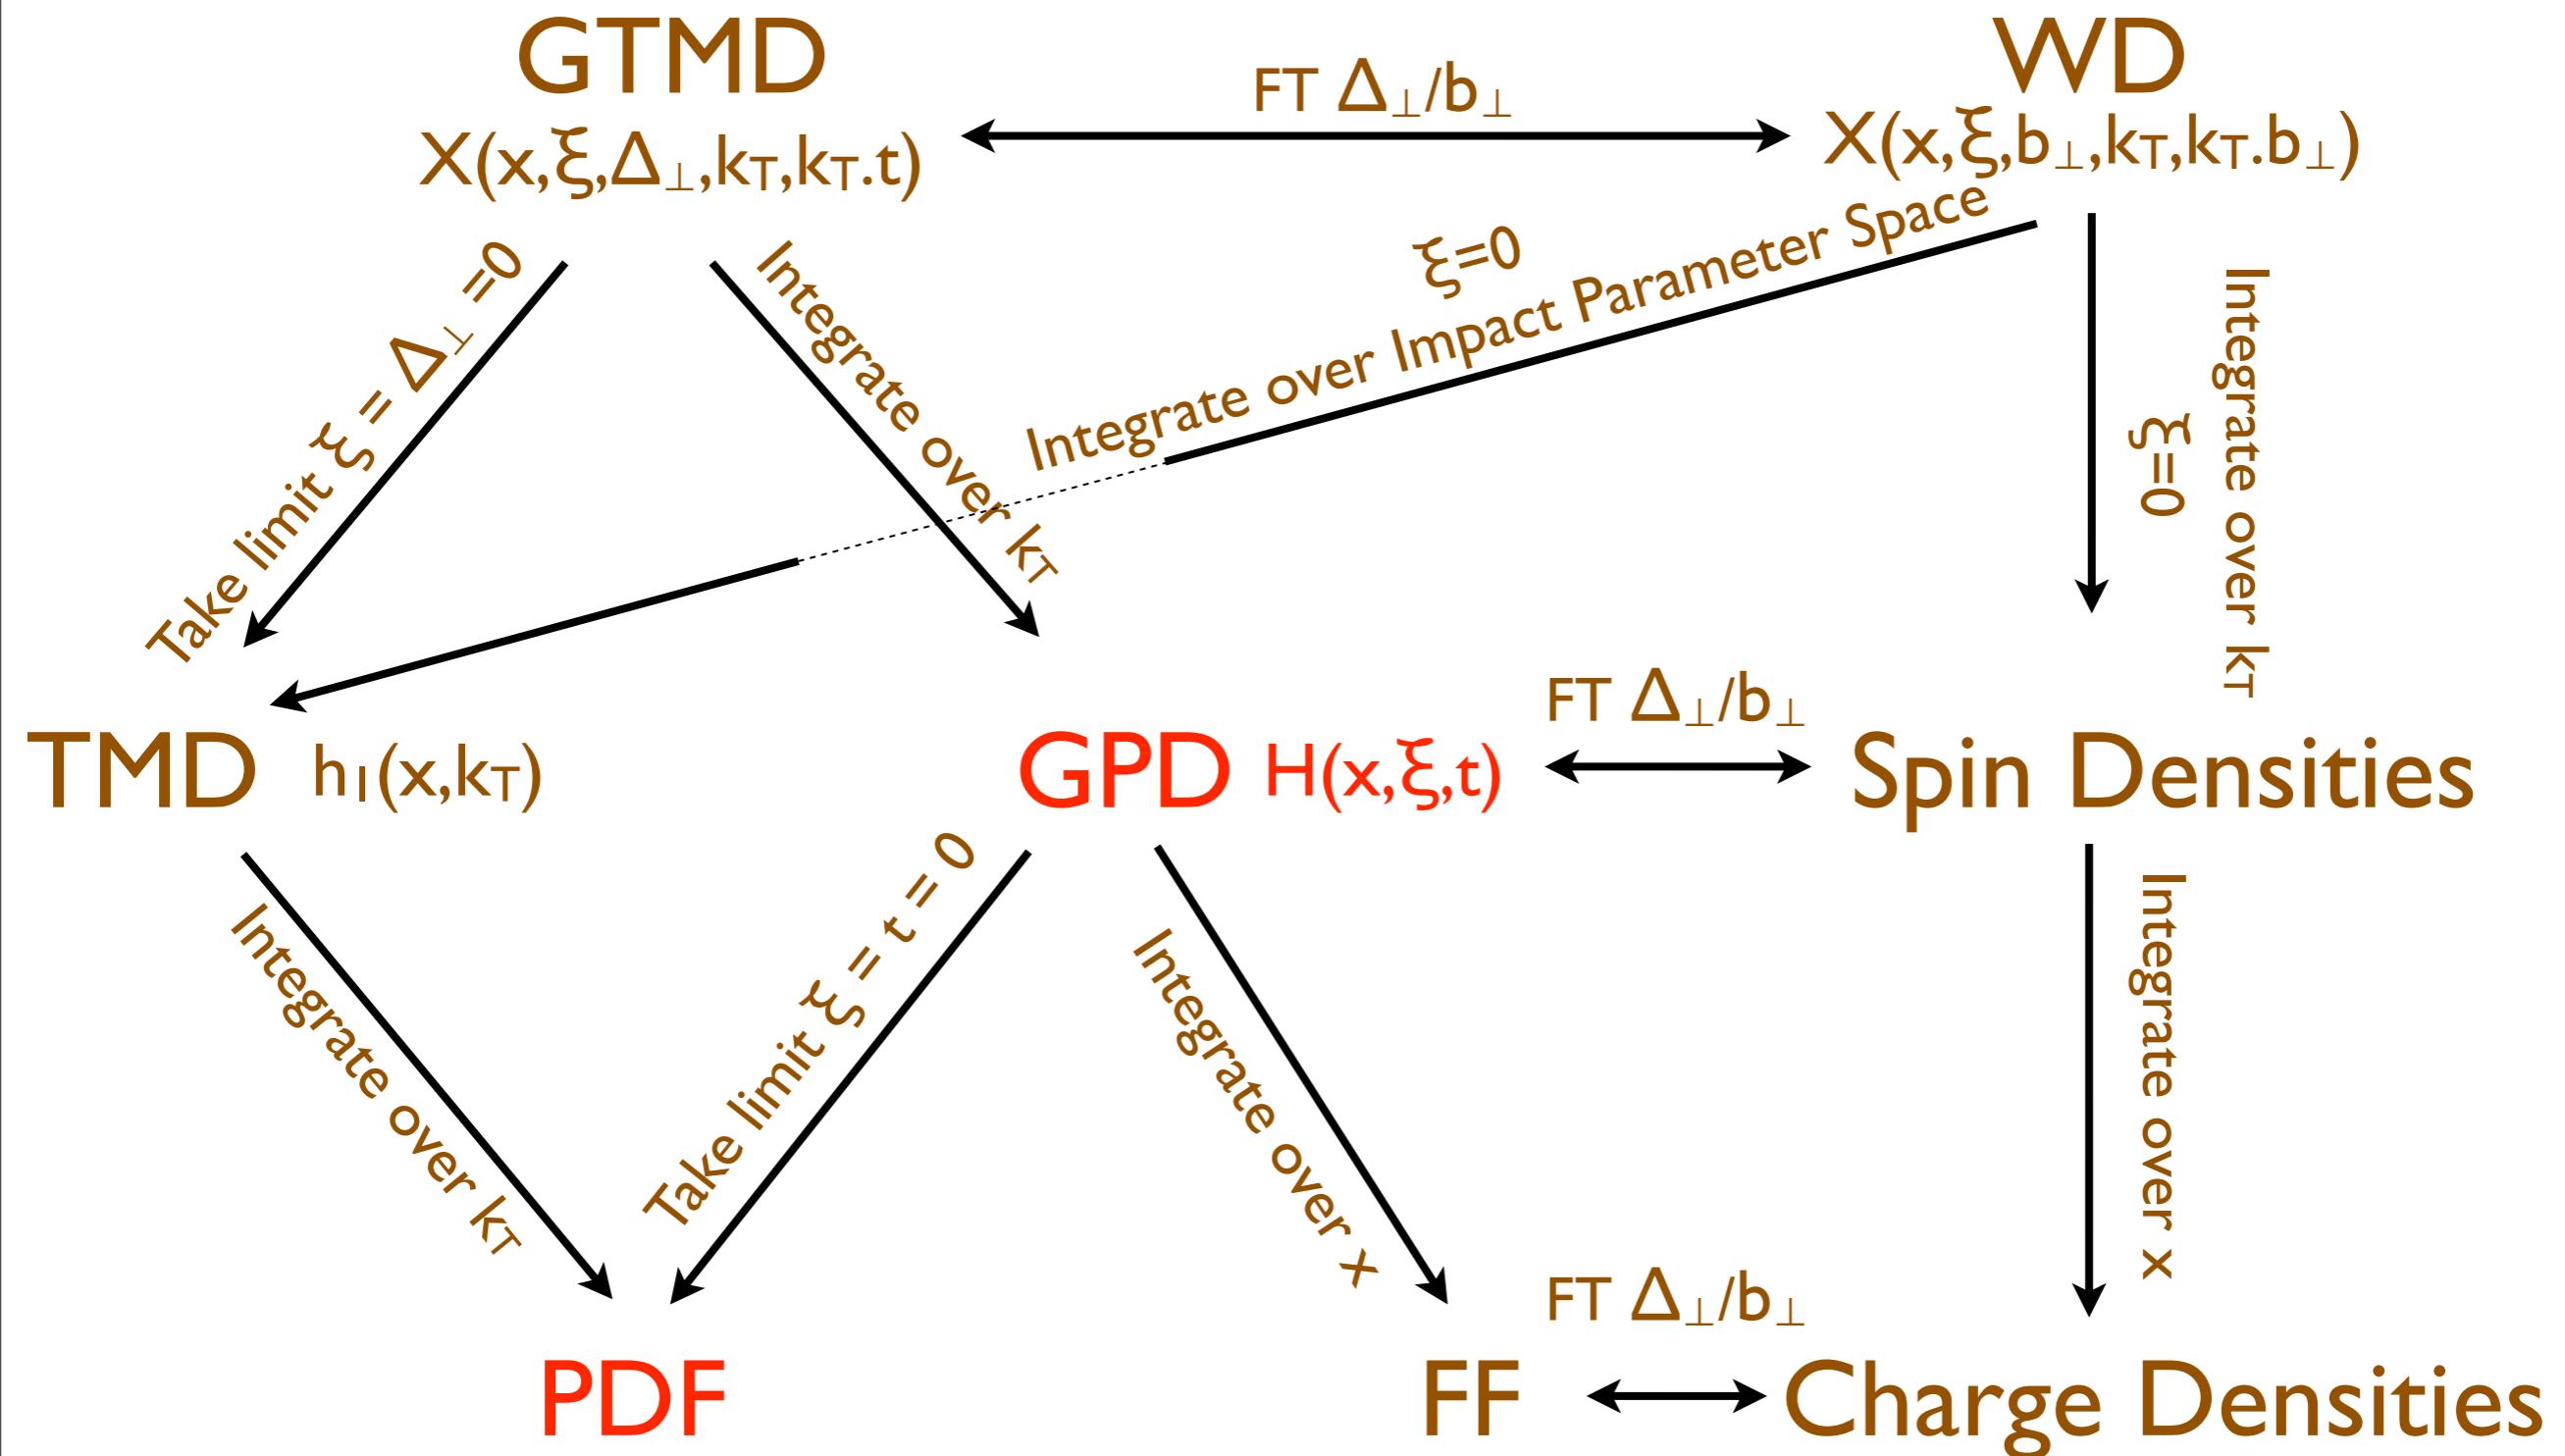

Diffraction 2012

Distribution Graph

Distribution Graph

PDFs & Inclusive Physics

F_1, F_2 and g_1 all comparatively well-known

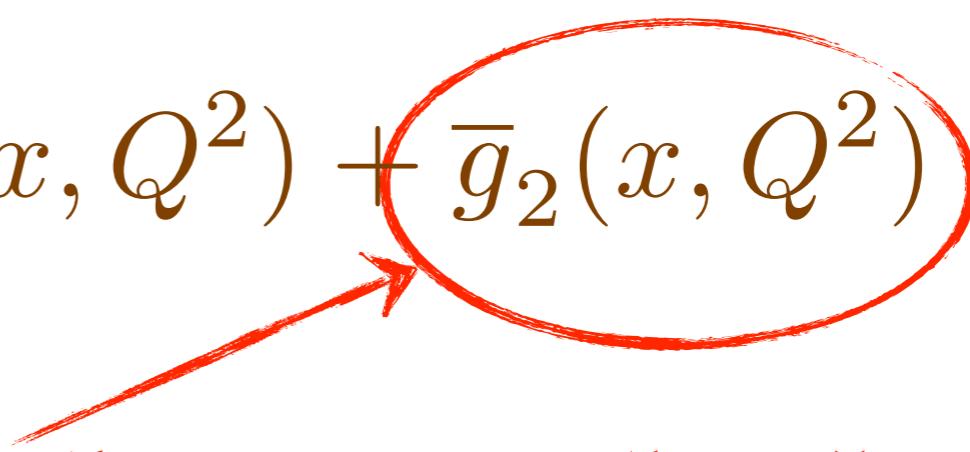

New HERMES data on A_2 and g_2 available - also measured at CERN and SLAC

$$g_2(x, Q^2) = g_s^{WW}(x, Q^2) + \bar{g}_2(x, Q^2)$$

PDFs & Inclusive Physics

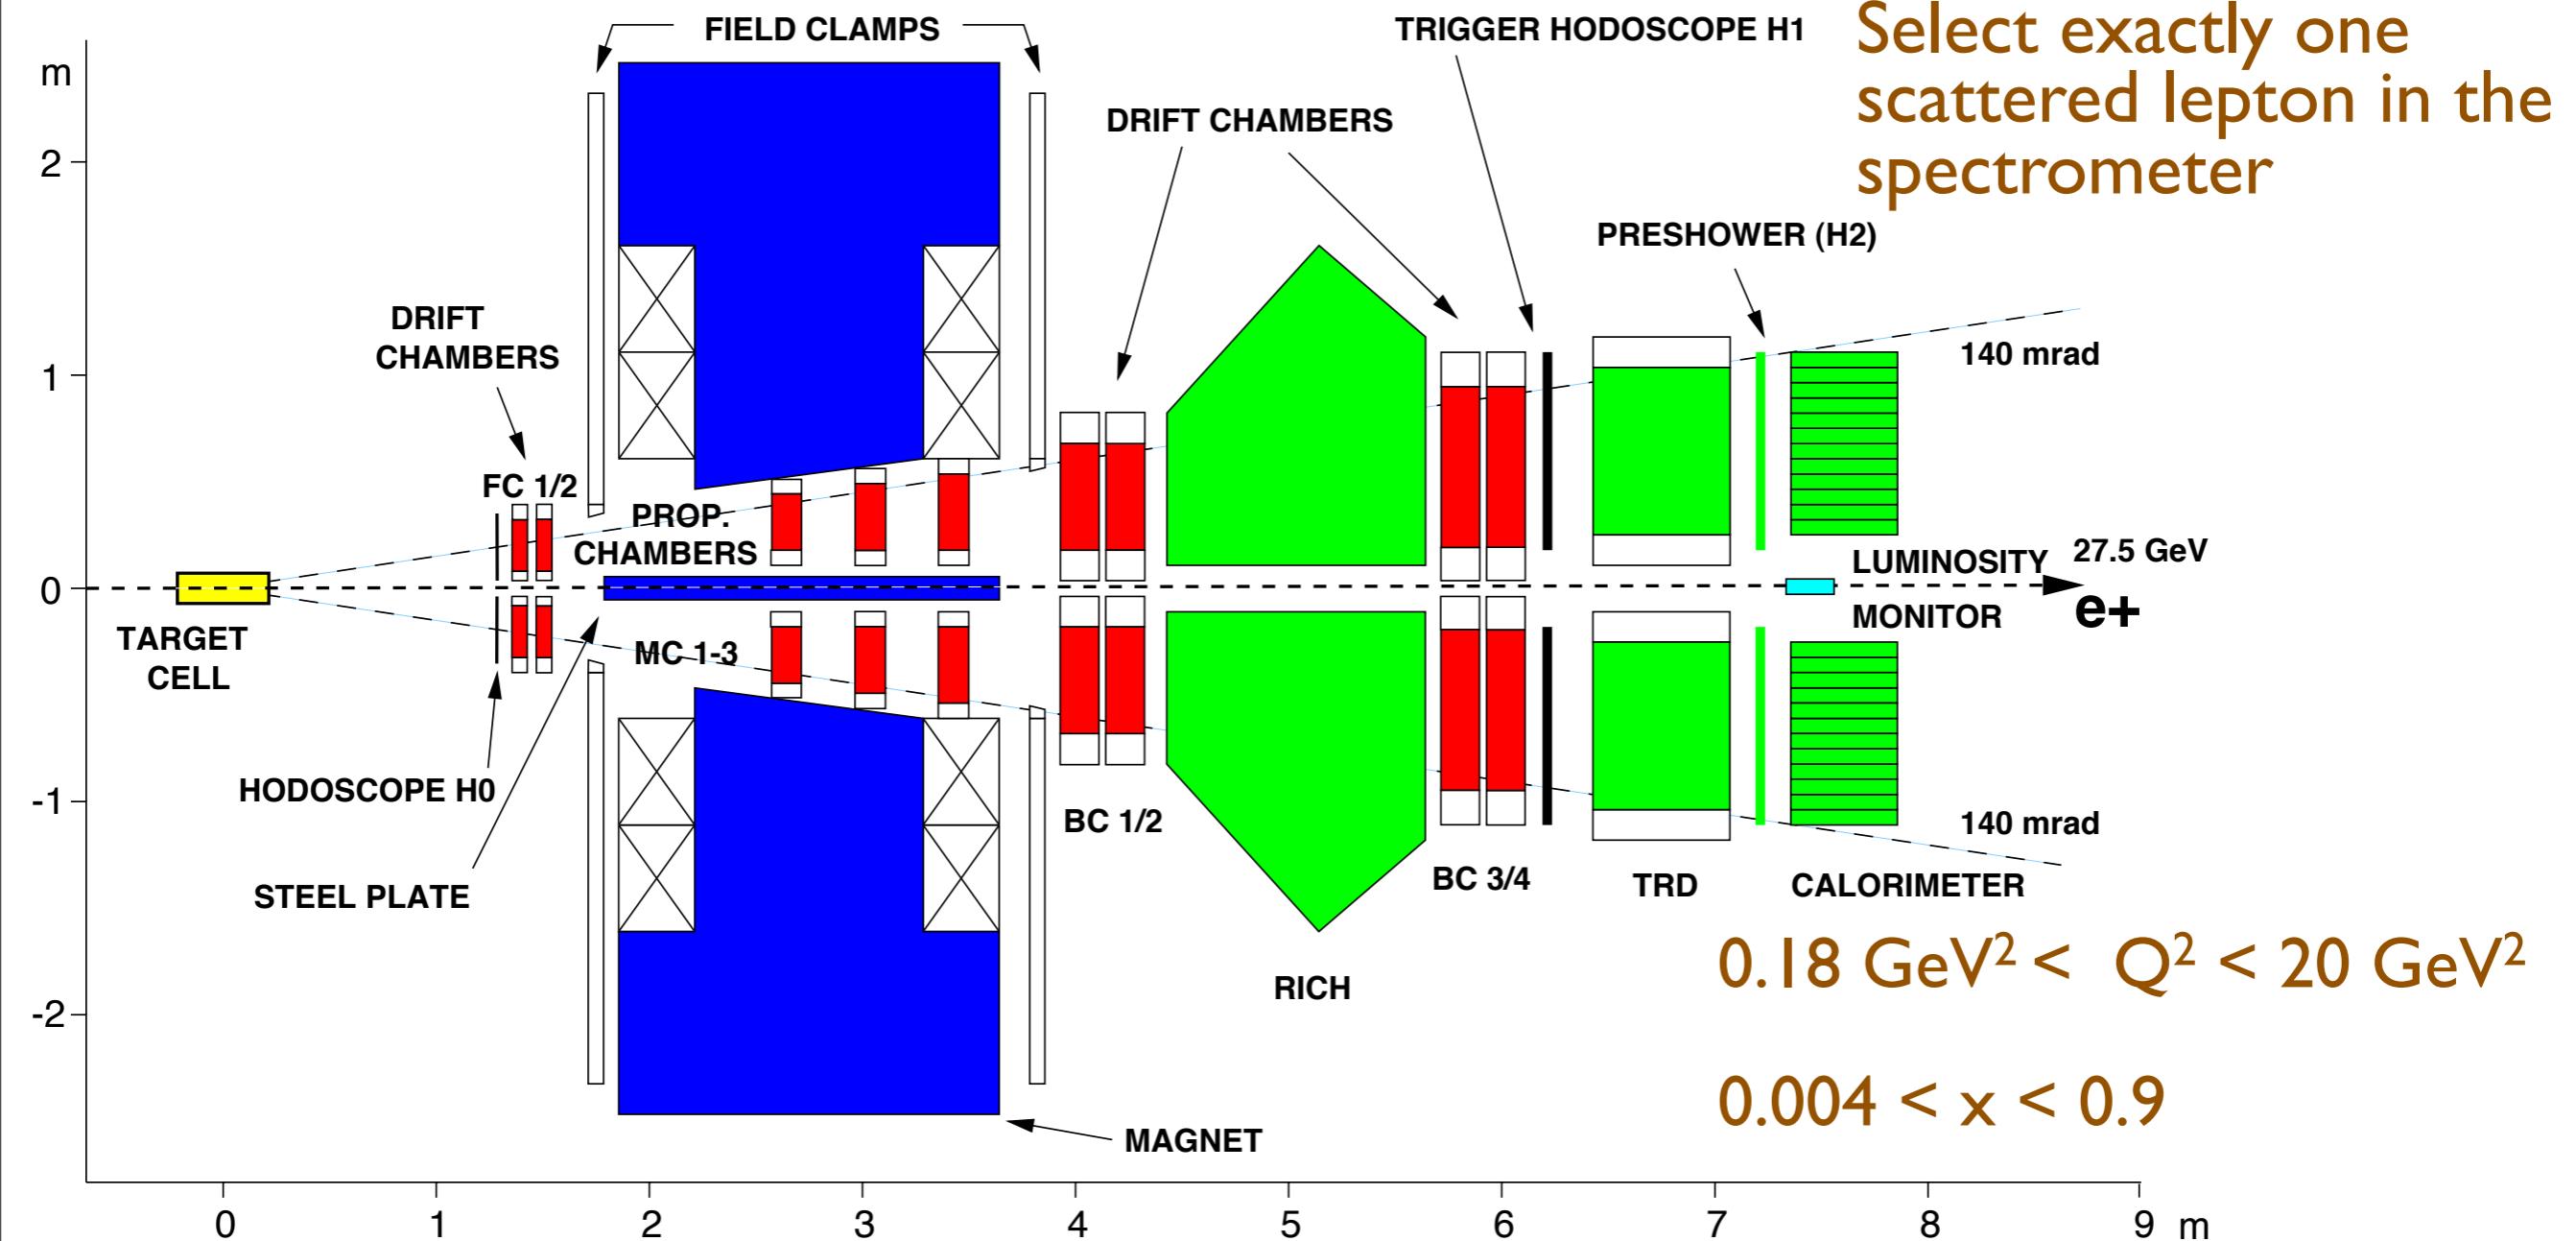

F_1, F_2 and g_1 all comparatively well-known

New HERMES data on A_2 and g_2 available - also measured at CERN and SLAC

$$g_2(x, Q^2) = g_s^{WW}(x, Q^2) + \bar{g}_2(x, Q^2)$$

“pure” twist-3; related to quark-gluon correlations

g_2 @ HERMES

$$A_{LT}(x, Q^2, \phi, h_\ell) = h_\ell \frac{N^{h_\ell \uparrow}(x, Q^2, \phi) \mathcal{L}^{h_\ell \downarrow} - N^{h_\ell \downarrow}(x, Q^2, \phi) \mathcal{L}^{h_\ell \uparrow}}{N^{h_\ell \uparrow}(x, Q^2, \phi) \mathcal{L}_p^{h_\ell \downarrow} + N^{h_\ell \downarrow}(x, Q^2, \phi) \mathcal{L}_p^{h_\ell \uparrow}}$$

A_2, g_2 Extraction Procedure

Unfold in bins of (x, Q^2, ϕ)

$$A_{LT}(x, Q^2, \phi, h_\ell) = h_\ell \frac{N^{h_\ell \uparrow\uparrow}(x, Q^2, \phi) \mathcal{L}^{h_\ell \downarrow\downarrow} - N^{h_\ell \downarrow\downarrow}(x, Q^2, \phi) \mathcal{L}^{h_\ell \uparrow\uparrow}}{N^{h_\ell \uparrow\uparrow}(x, Q^2, \phi) \mathcal{L}_p^{h_\ell \downarrow\downarrow} + N^{h_\ell \downarrow\downarrow}(x, Q^2, \phi) \mathcal{L}_p^{h_\ell \uparrow\uparrow}}$$

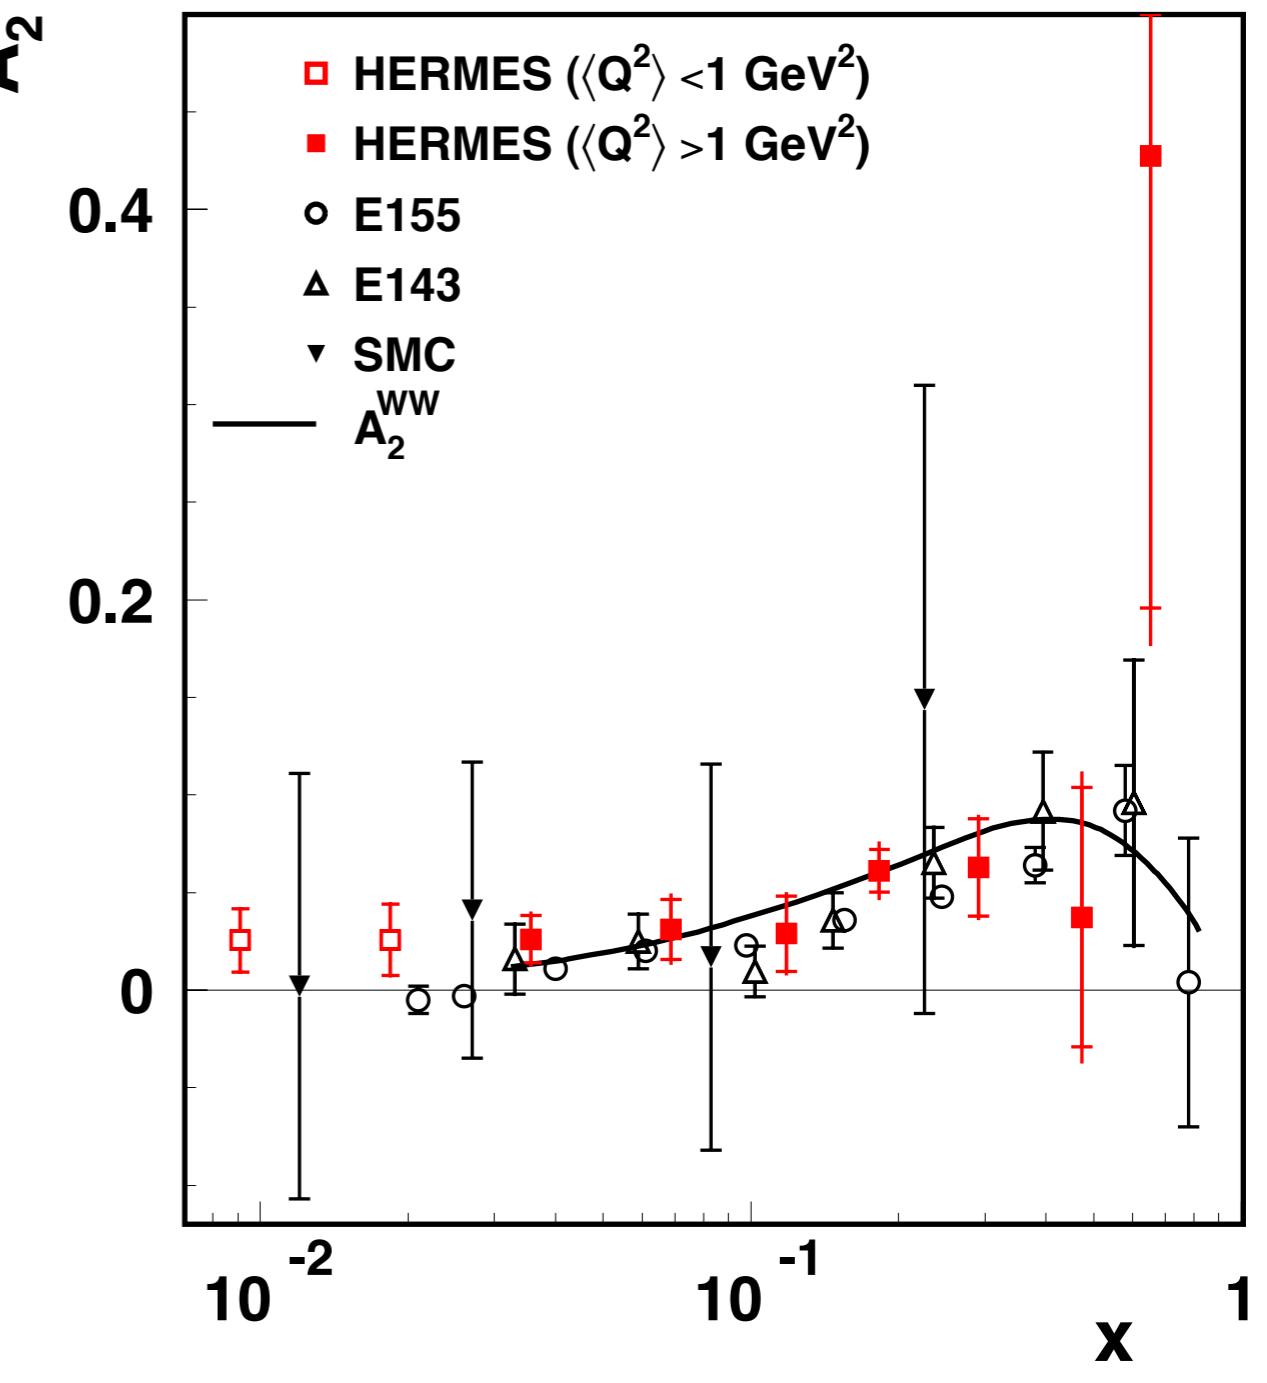

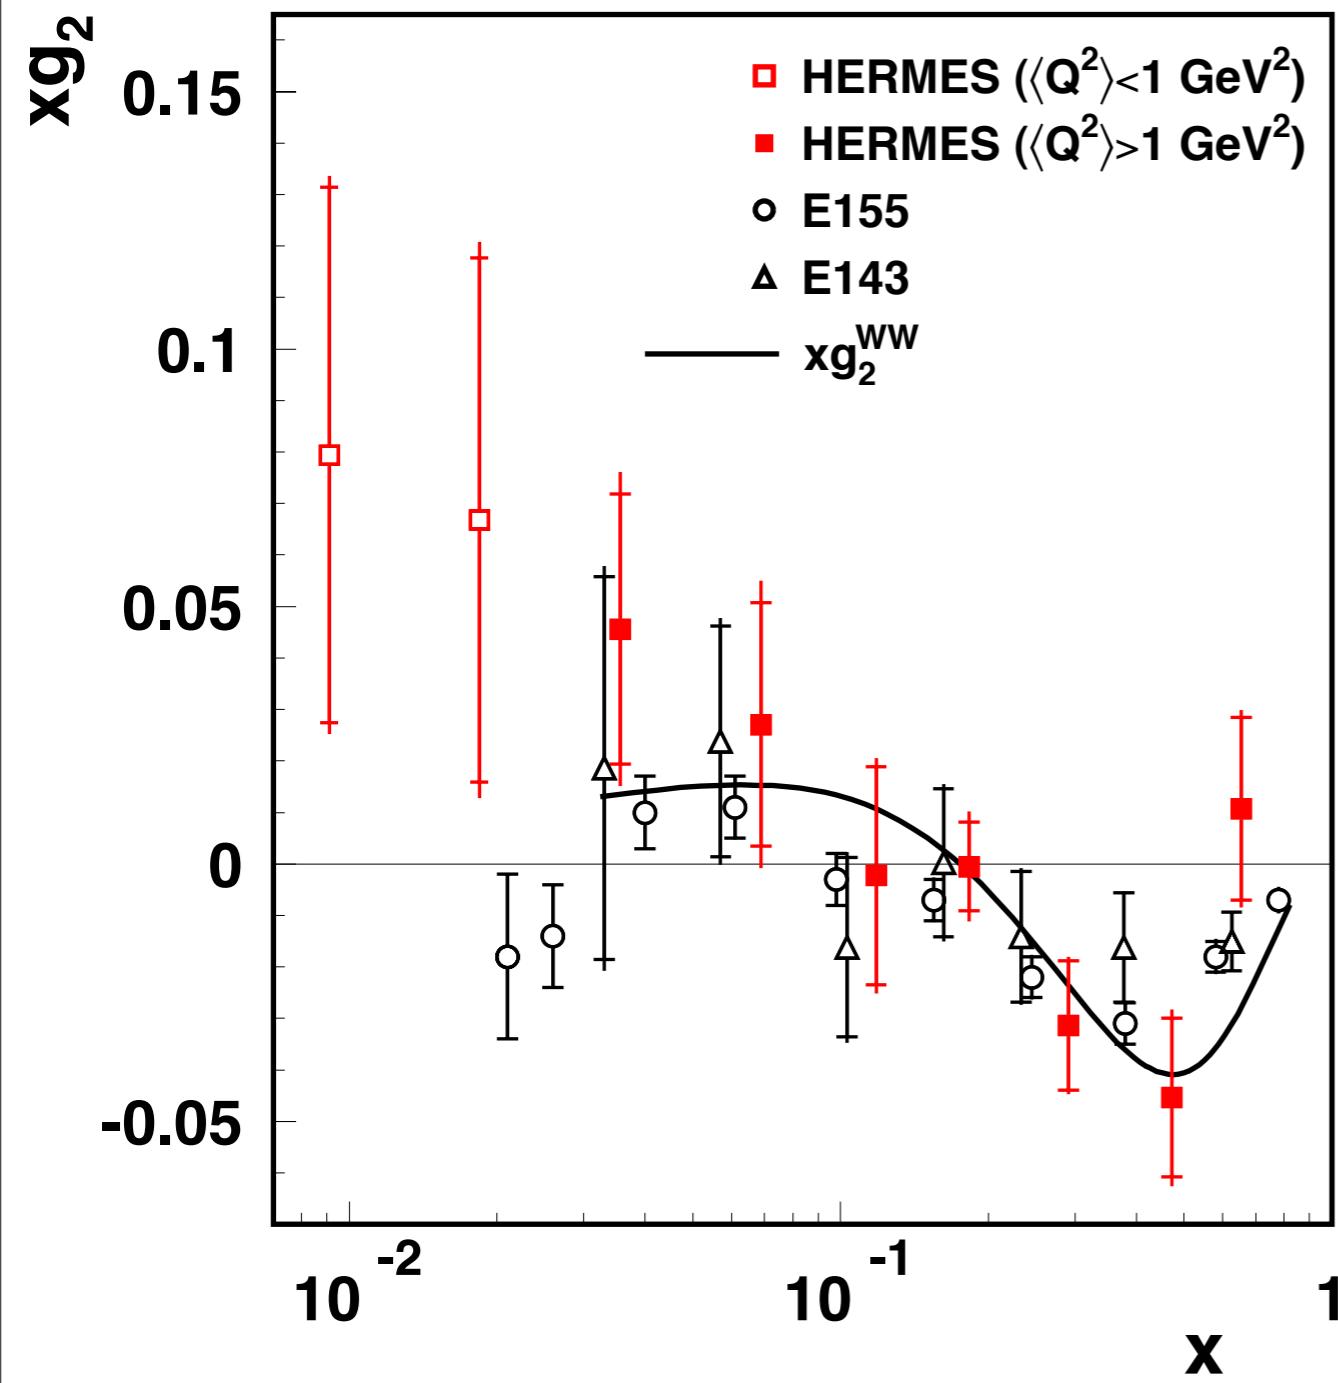

Fit result with functional form:

$$A_{LT}(x, Q^2, \phi, h_\ell) = -A_T(x, Q^2) \cos \phi$$

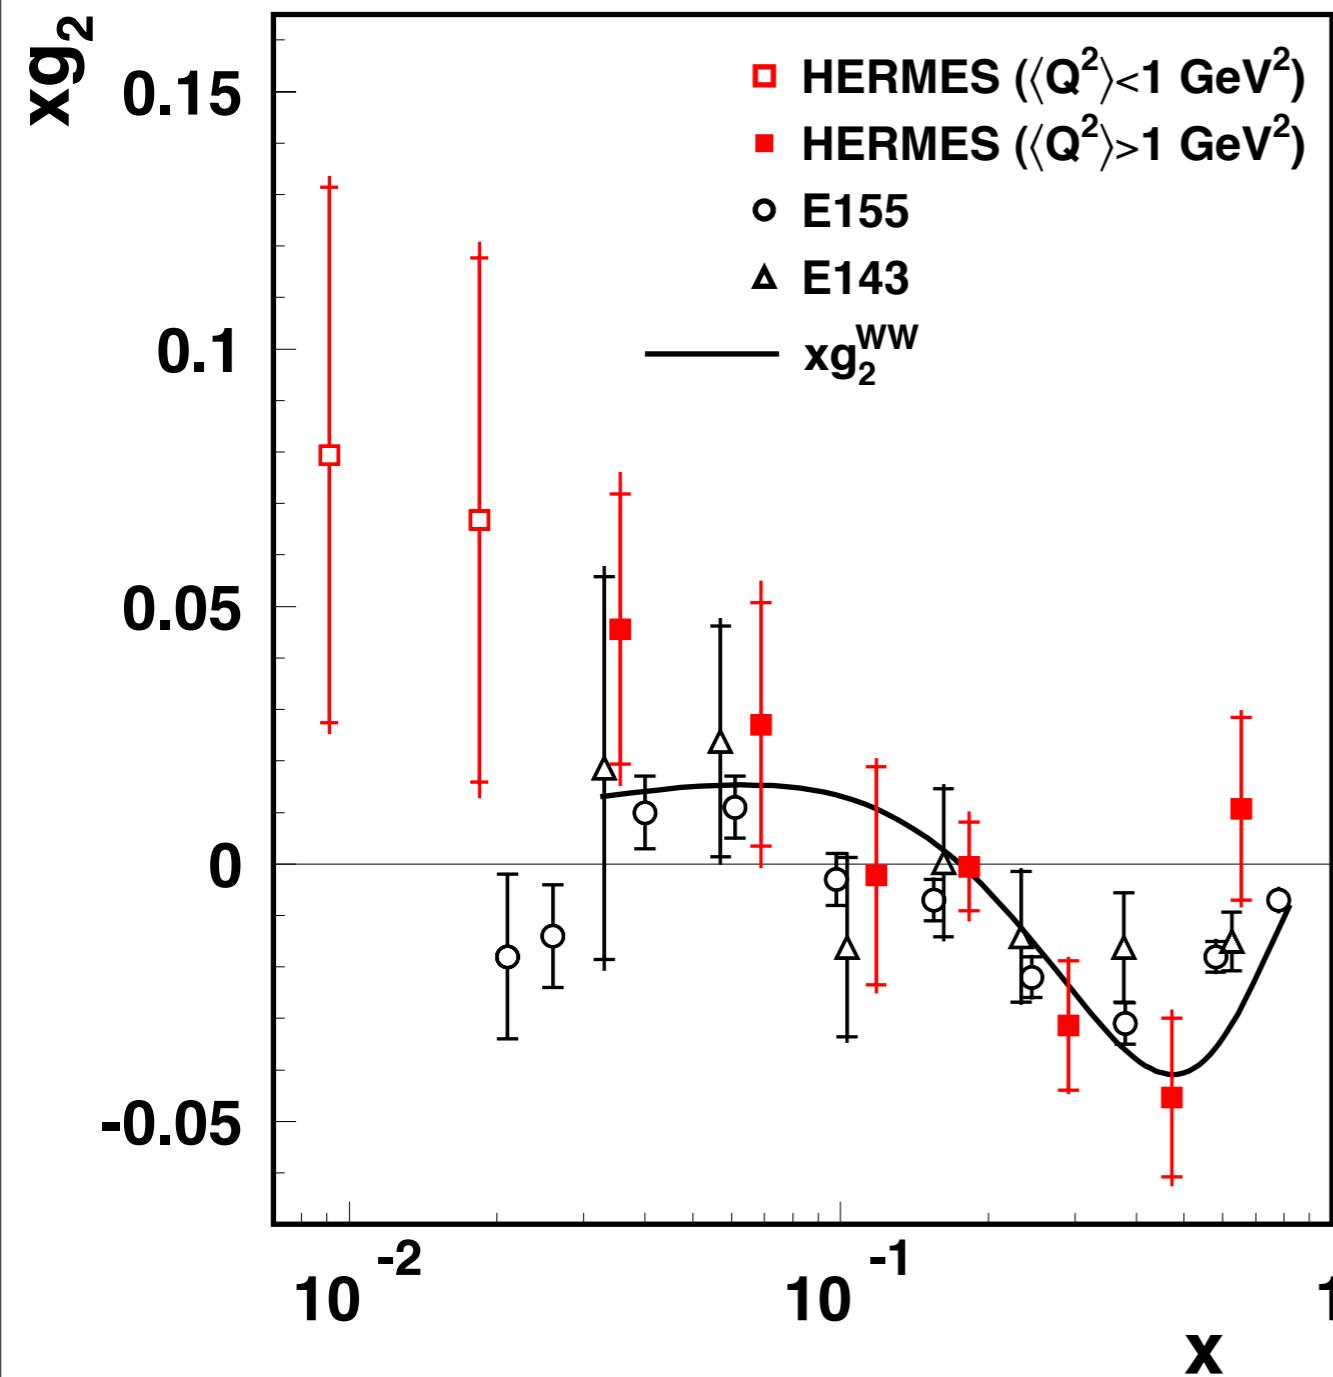

Calculate g_2 and A_2 using:

$$g_2 = \frac{F_1}{\gamma(1 + \gamma\xi)} \left(\frac{A_T}{d} - (\gamma - \xi) \frac{g_1}{F_1} \right) \quad A_2 = \frac{1}{1 + \gamma\xi} \left(\frac{A_T}{d} + \xi(1 + \gamma^2) \frac{g_1}{F_1} \right)$$

A_2, g_2 Extraction Procedure

A_2, g_2 Extraction Procedure

Results are separated into $< 1 \text{ GeV}^2$ and $> 1 \text{ GeV}^2$ series

Compared to SLAC E143 and E155 experiments

Also shown against a theoretical prediction from

[E155 Coll., P.L.Anthony et al., Phys. Lett. B 493, 19\(2000\).](#)

Consistent with CB sum-rule

A_2, g_2 Extraction Procedure

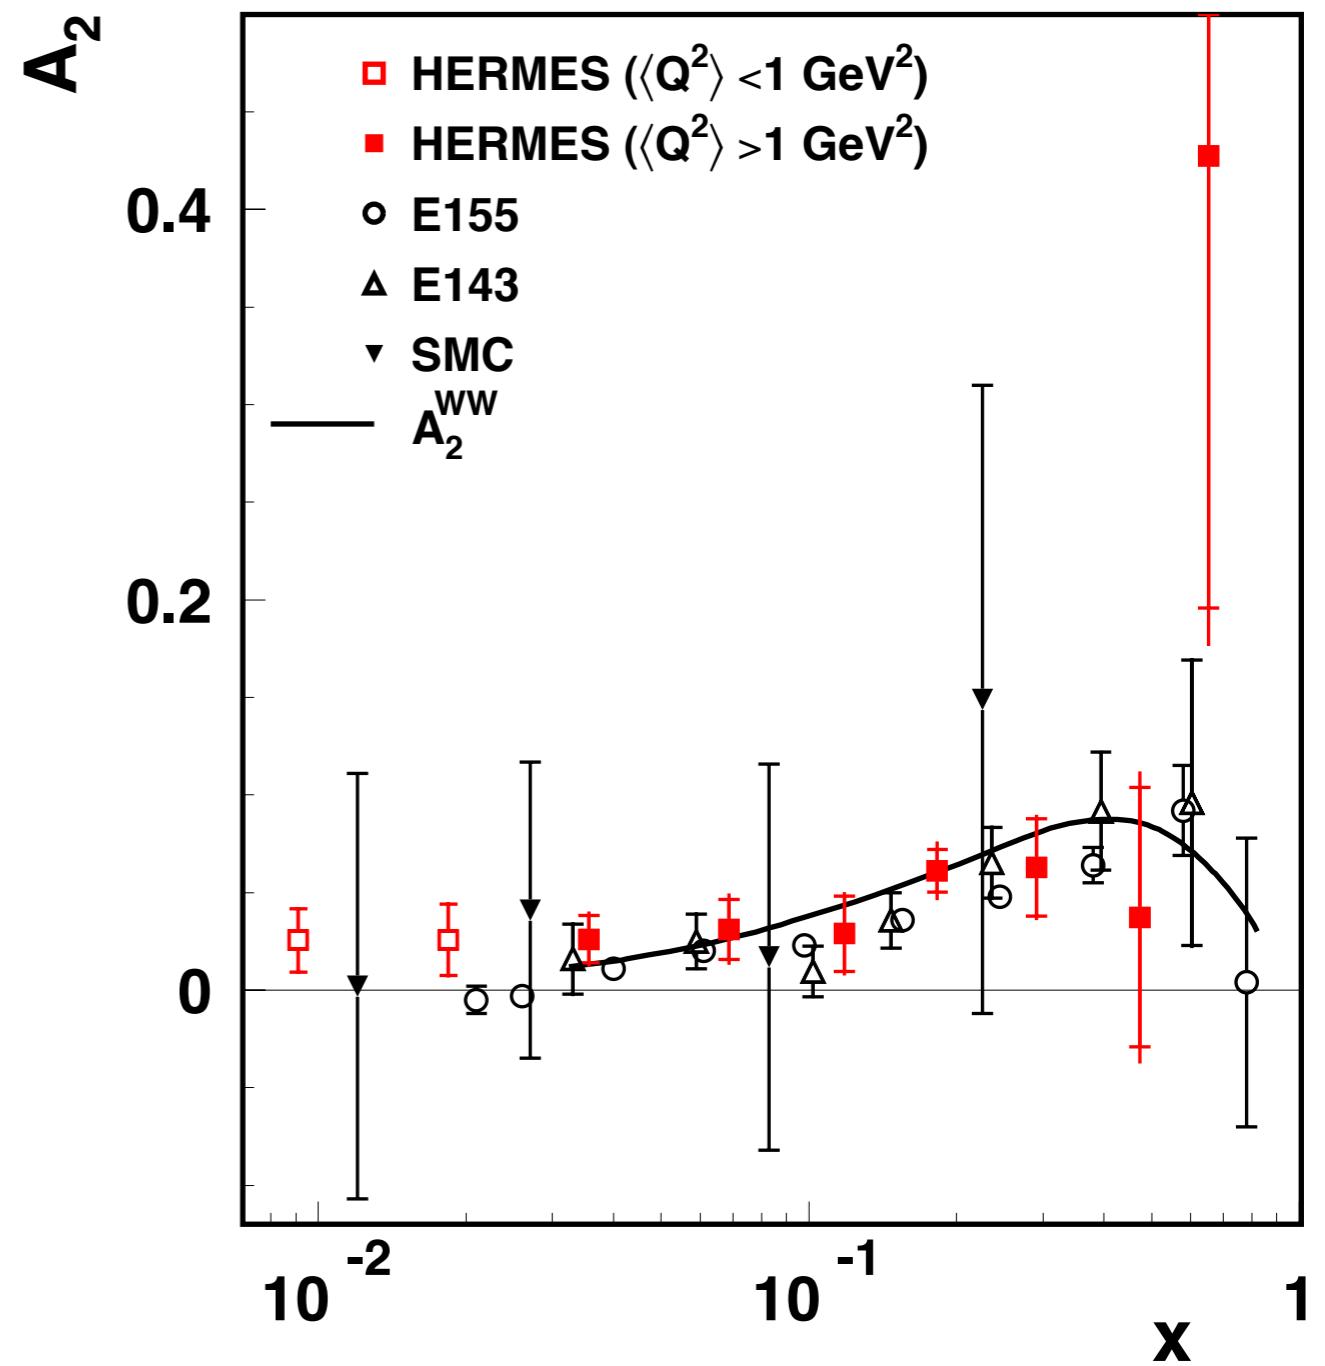

Results are separated into $< 1 \text{ GeV}^2$ and $> 1 \text{ GeV}^2$ series

Compared to SLAC E143 and E155 experiments and SMC

Also shown against a theoretical prediction from

[E155 Coll., P.L. Anthony et al., Phys. Lett. B 493, 19\(2000\).](#)

Statistical precision not enough to determine non-WW behaviour

g_2, A_2 Conclusions

A_2 and g_2 have been extracted at HERMES from the A_{LT} inclusive asymmetry.

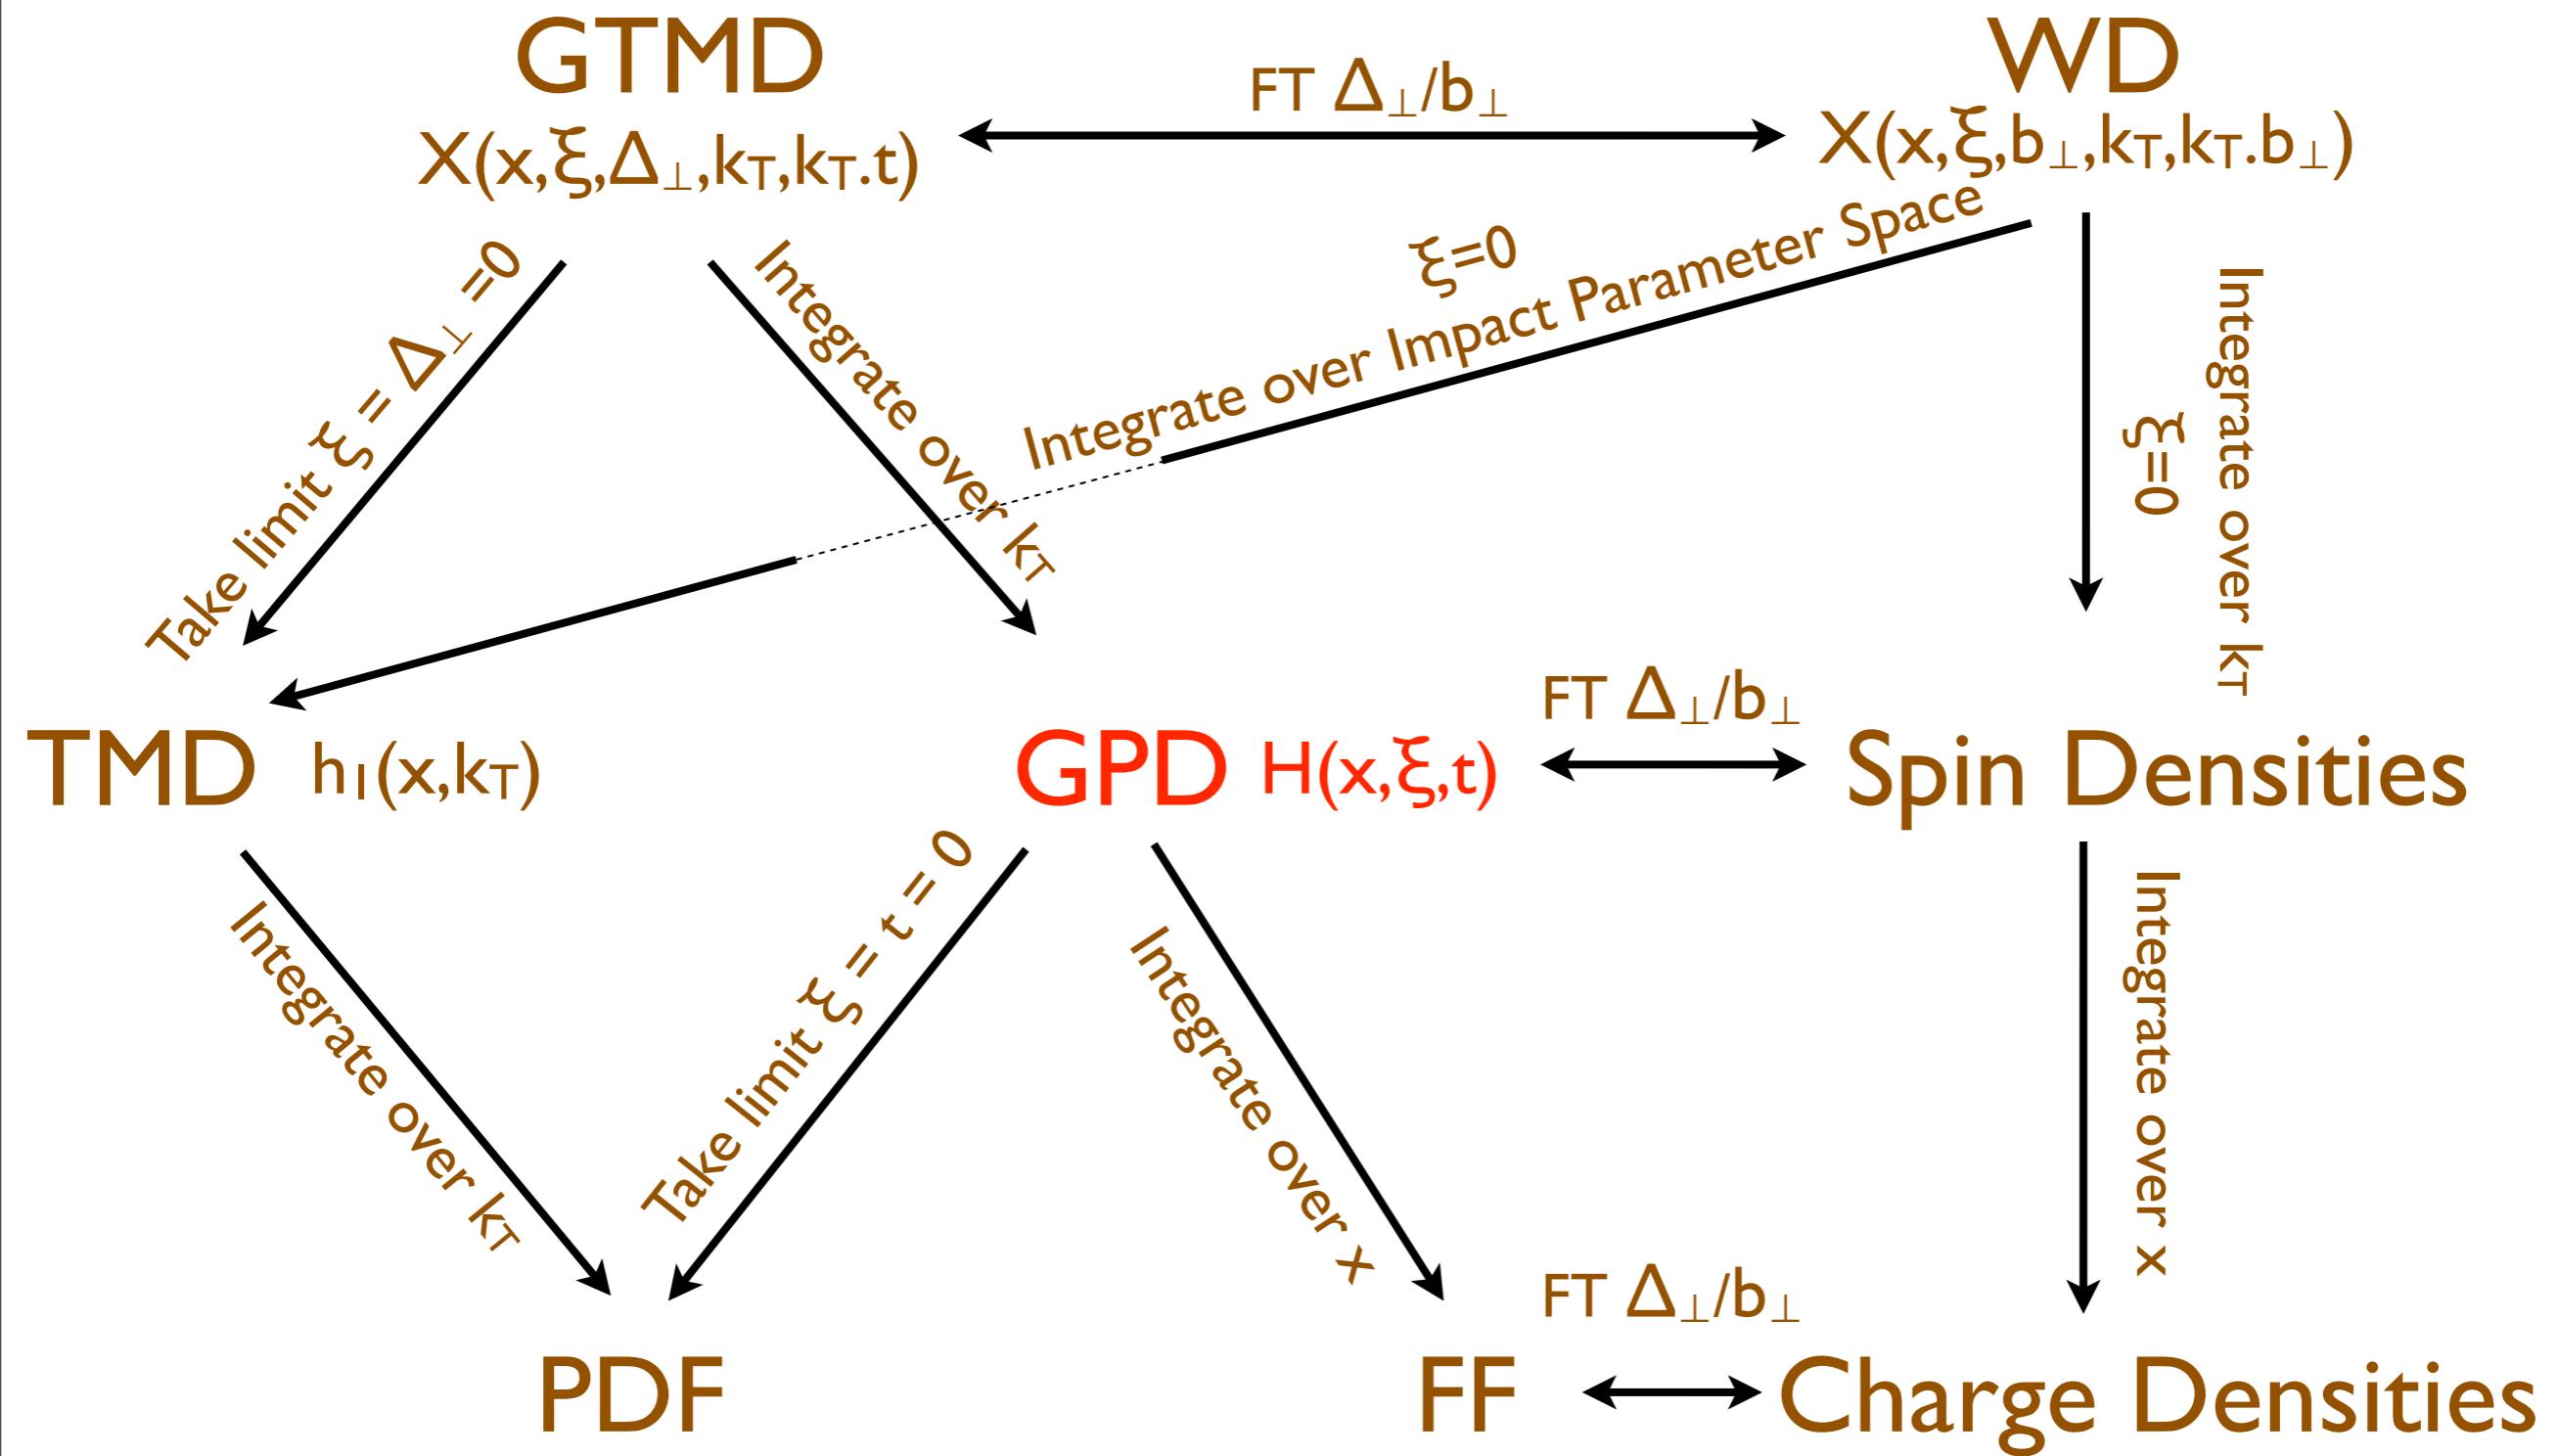

The results confirm the Burkhardt-Cottingham sum-rule for g_2 and are consistent with SLAC and CERN data (A_2 only).

Sit alongside measurements of F_2 and g_1 as contributions from HERMES to inclusive structure functions

F_2 : [A. Airapetian et al, JHEP 05 \(2011\) 126](#)

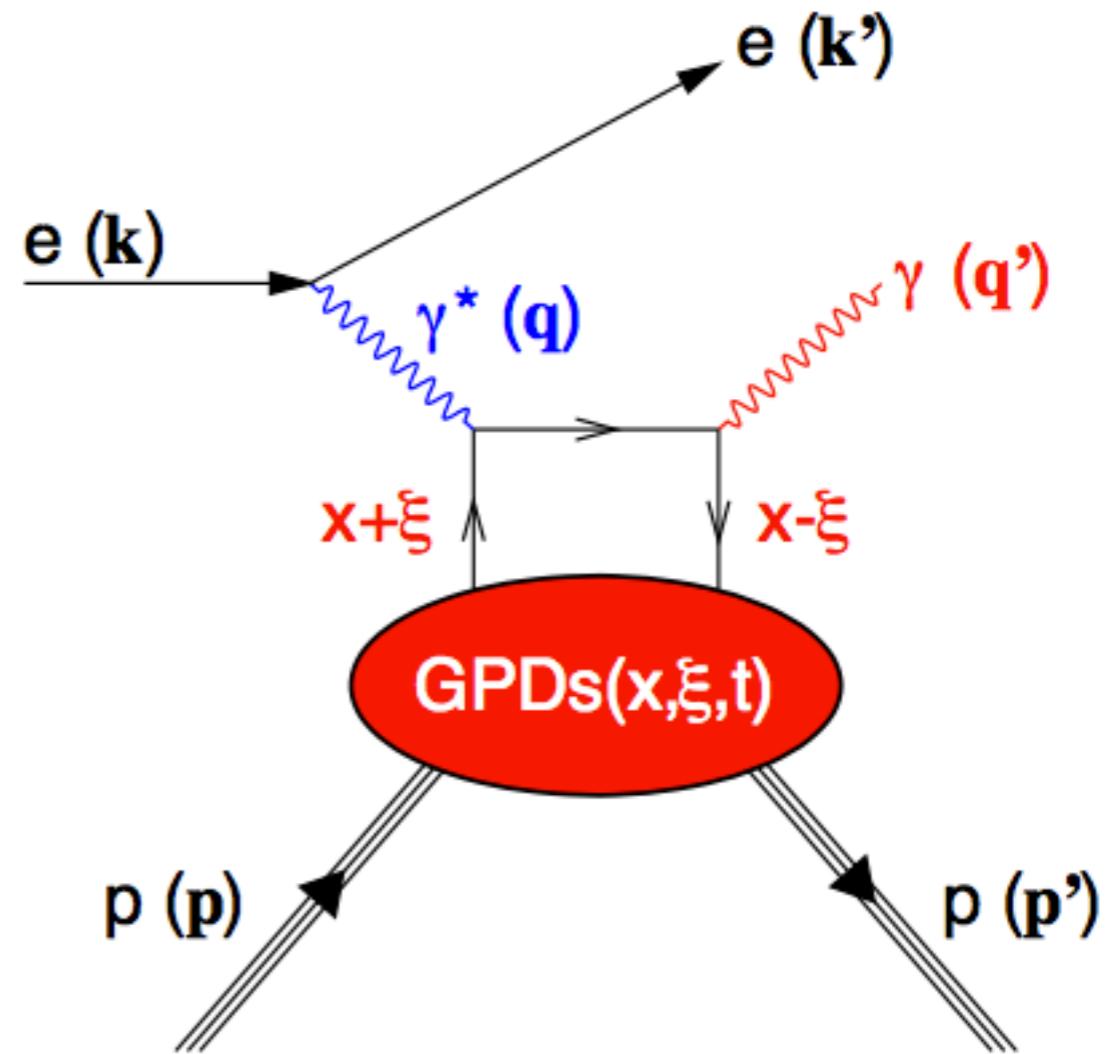

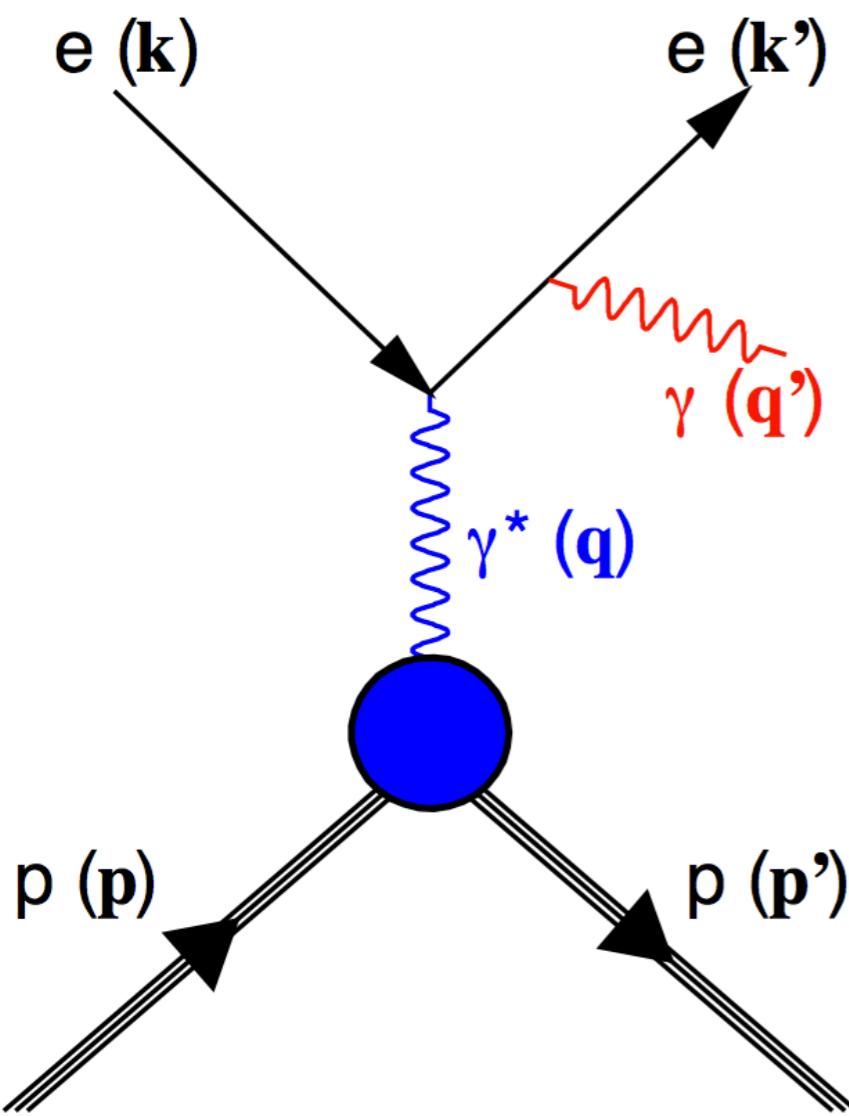

g_1 : [A. Airapetian et al, Phys. Rev. D 75 \(2007\) 012007](#)

Distribution Graph

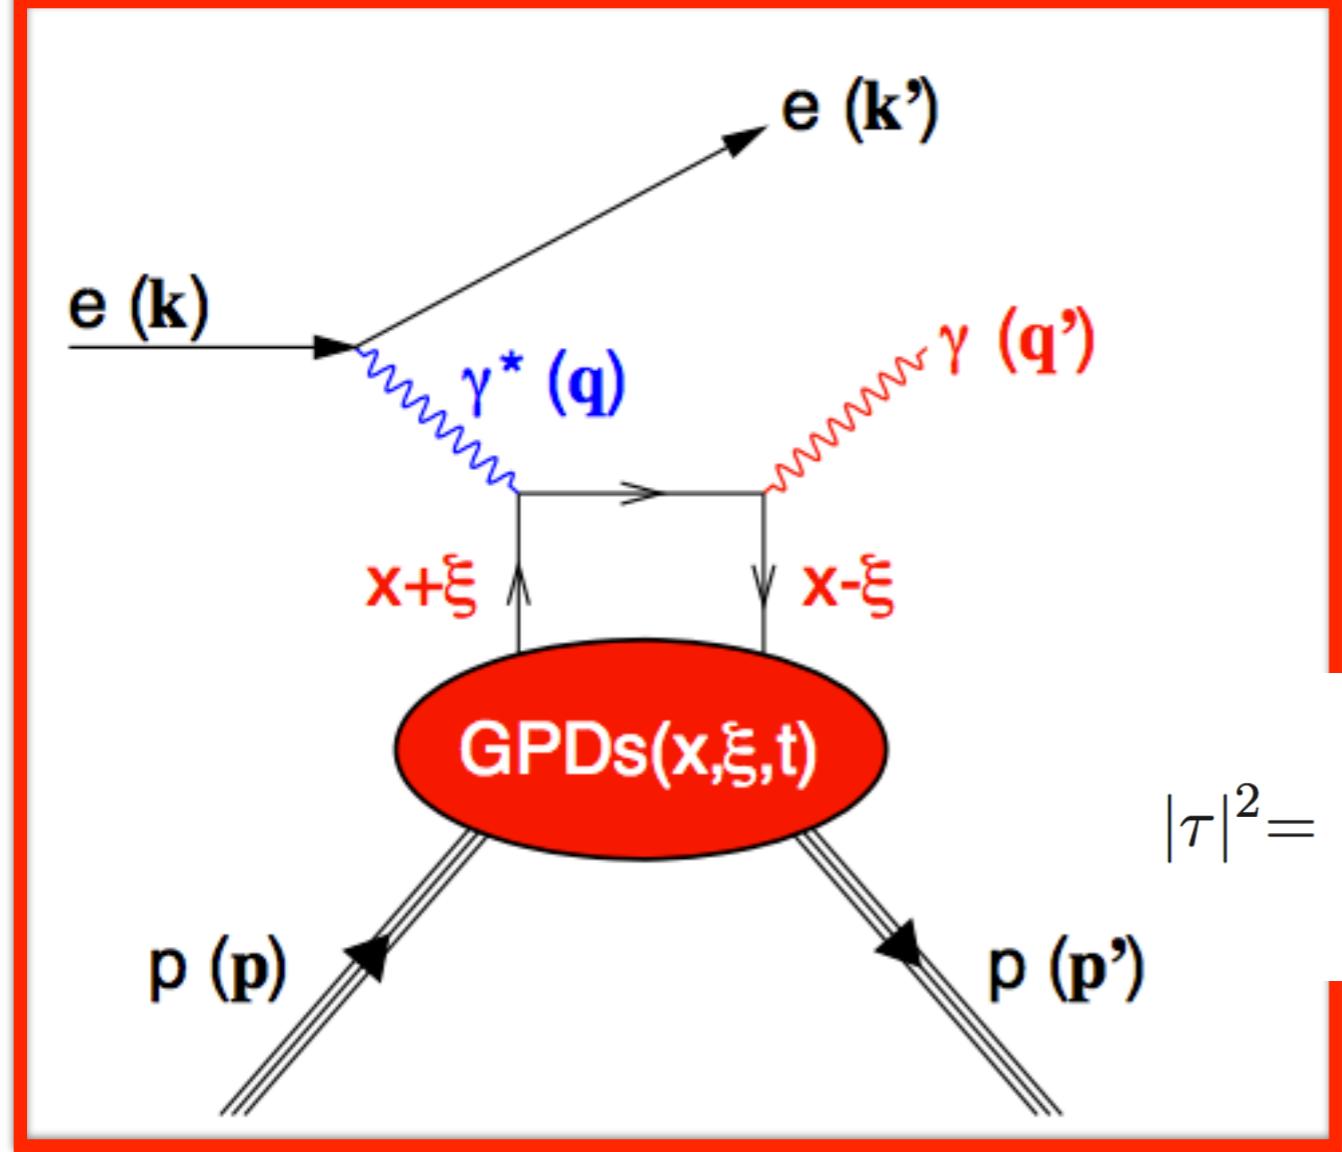

Deeply Virtual Compton Scattering

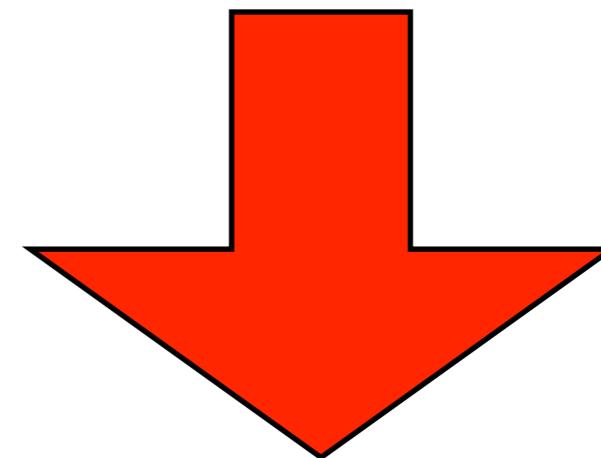

$e p \rightarrow e p \gamma$

Deeply Virtual Compton Scattering

$$\frac{d\sigma}{dx_B dQ^2 d|t| d\phi} = \frac{x_B e^6 |\tau|^2}{32(2\pi)^4 Q^4 \sqrt{1 + \epsilon^2}}$$

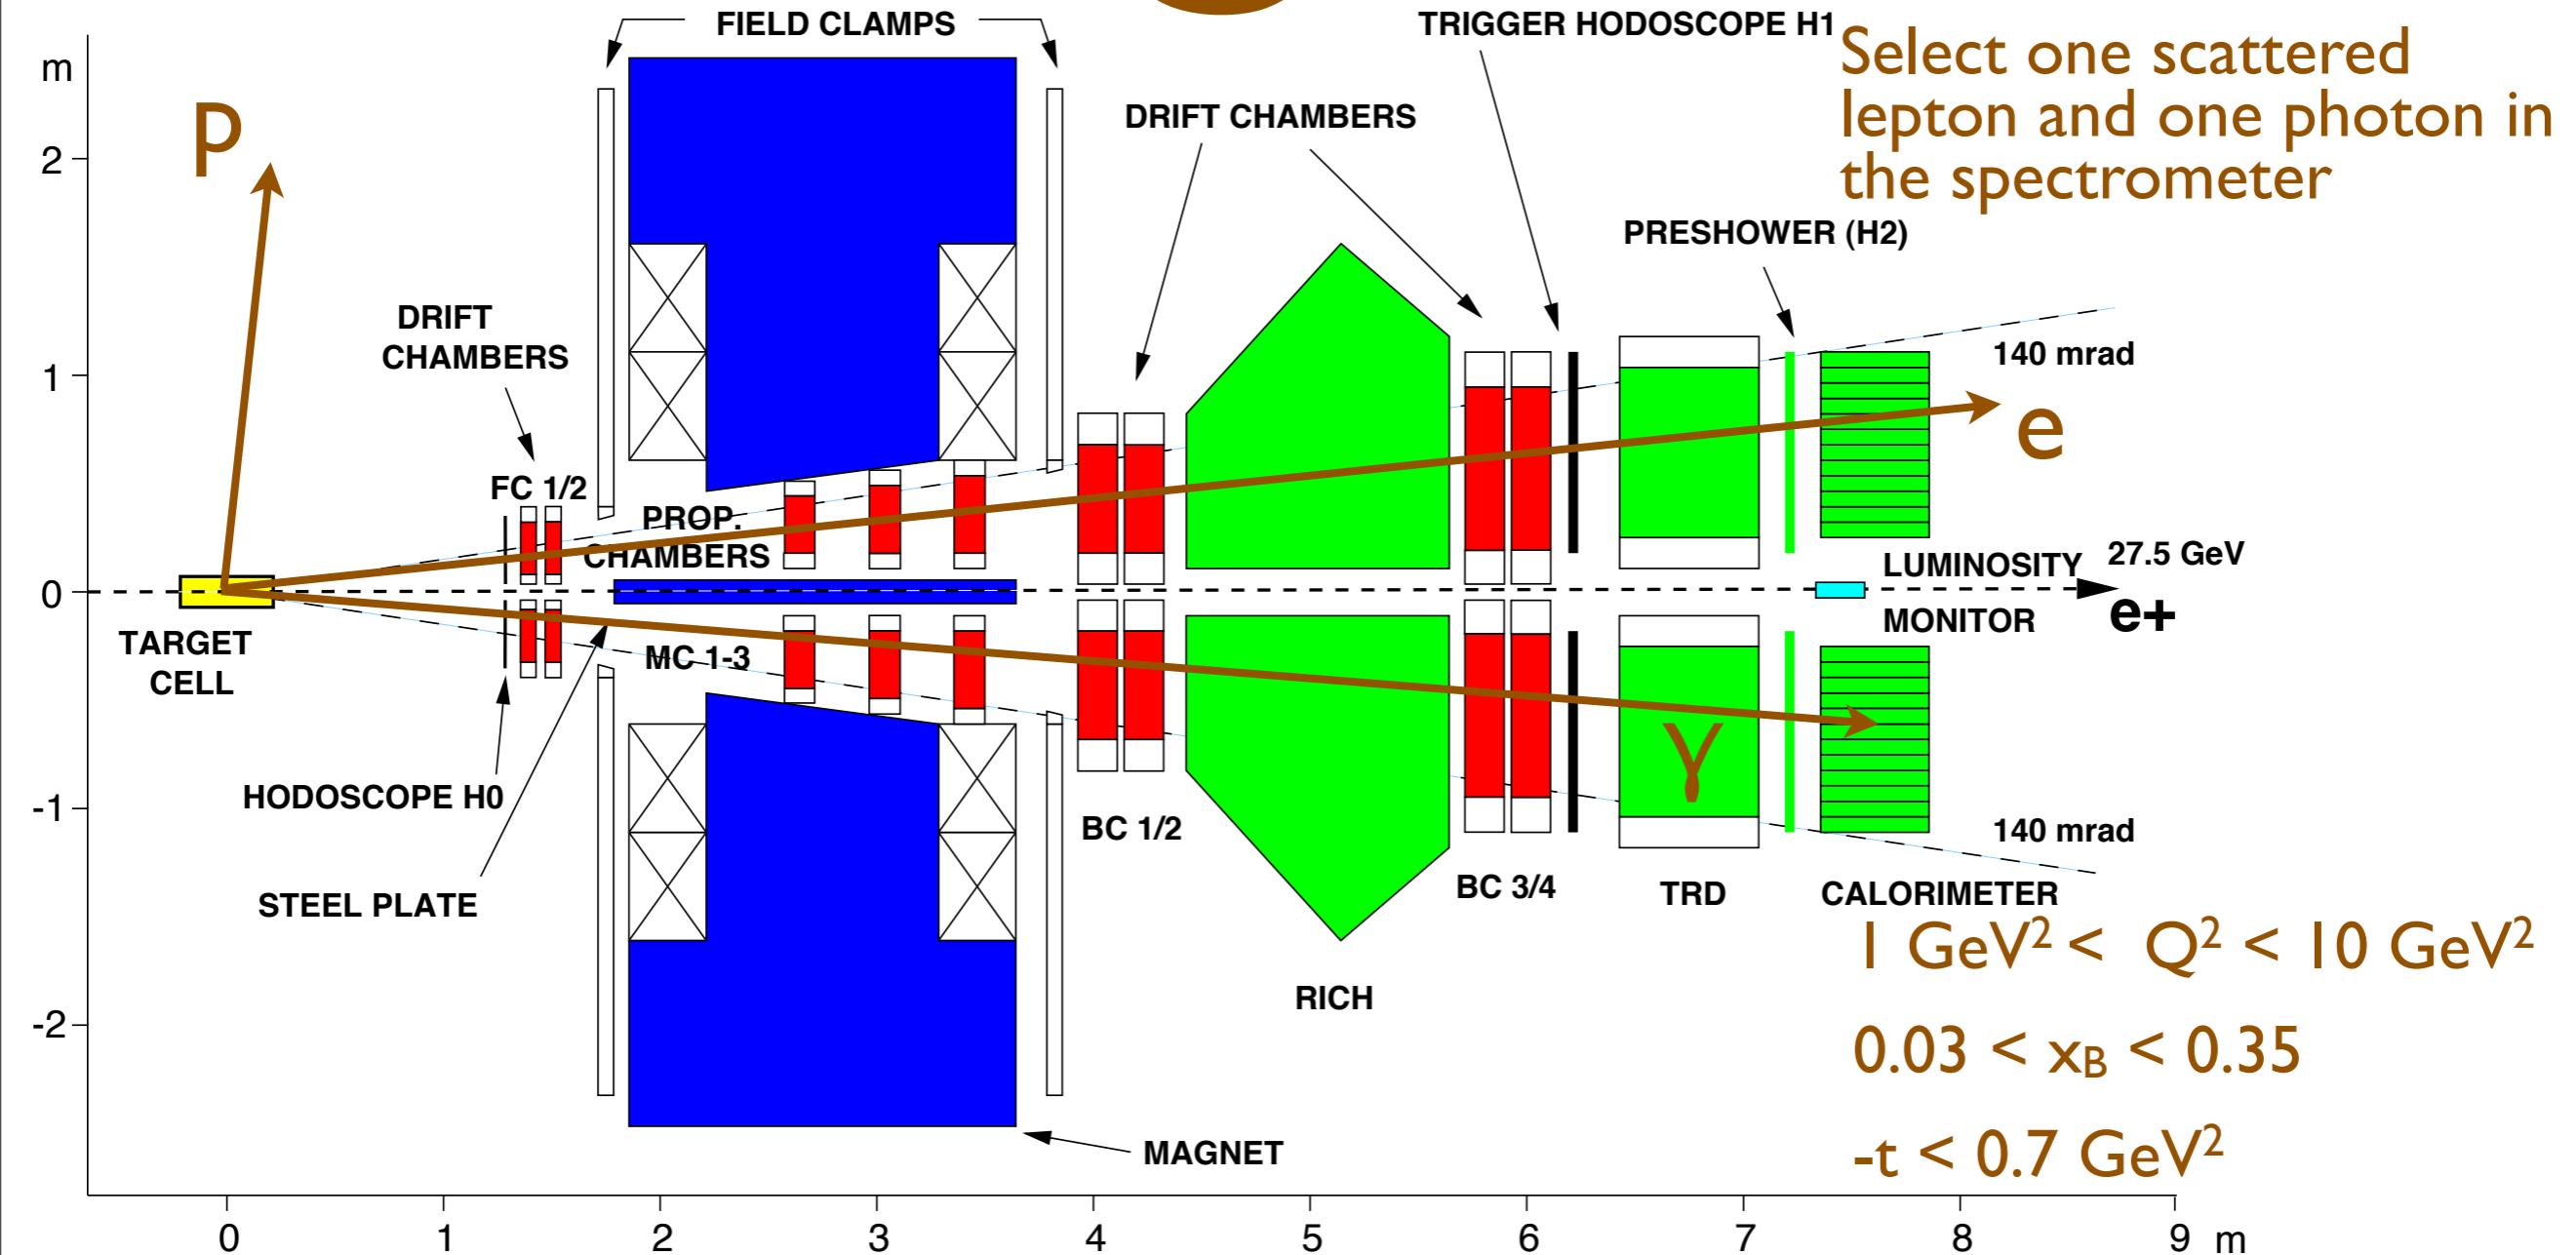

$$|\tau|^2 = |\tau_{BH}|^2 + \overbrace{|\tau_{DVCS}|^2 + \tau_{BH}\tau_{DVCS}^* + \tau_{BH}^*\tau_{DVCS}}^{\mathcal{I}}$$

DVCS @ HERMES

$\mathcal{A}_C(\phi) \equiv \frac{d\sigma^+(\phi) - d\sigma^-(\phi)}{d\sigma^+(\phi) + d\sigma^-(\phi)}$	\approx	$\text{Re}(\mathcal{H})$

Beam Helicity Asymmetries access $\text{Im}(\mathcal{H})$

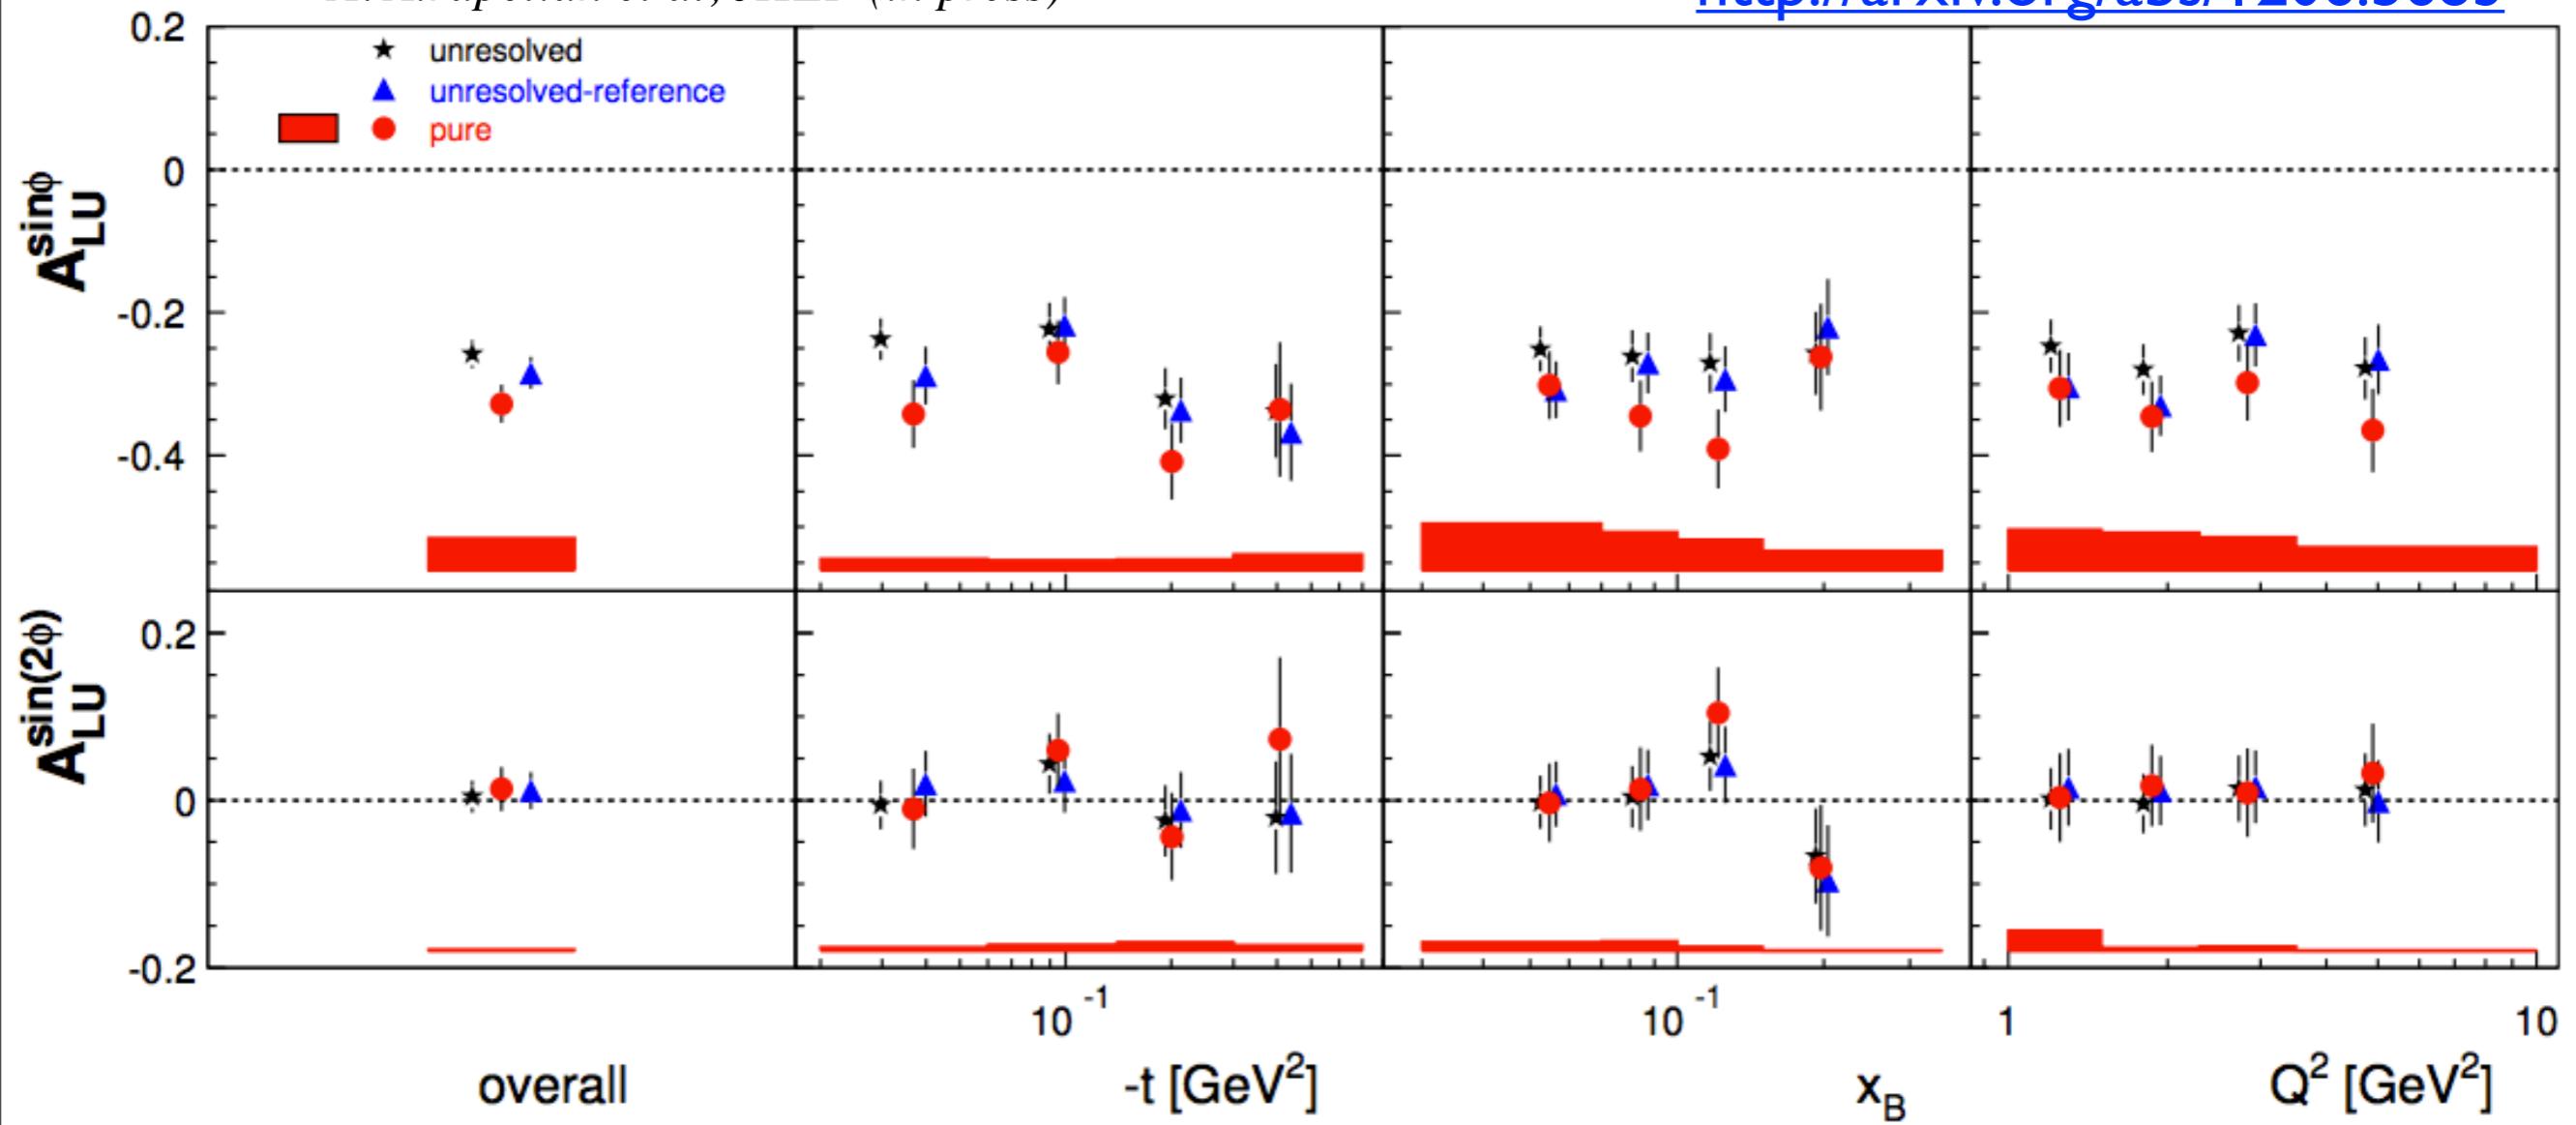

DVCS @ HERMES

Exclusive Measurement

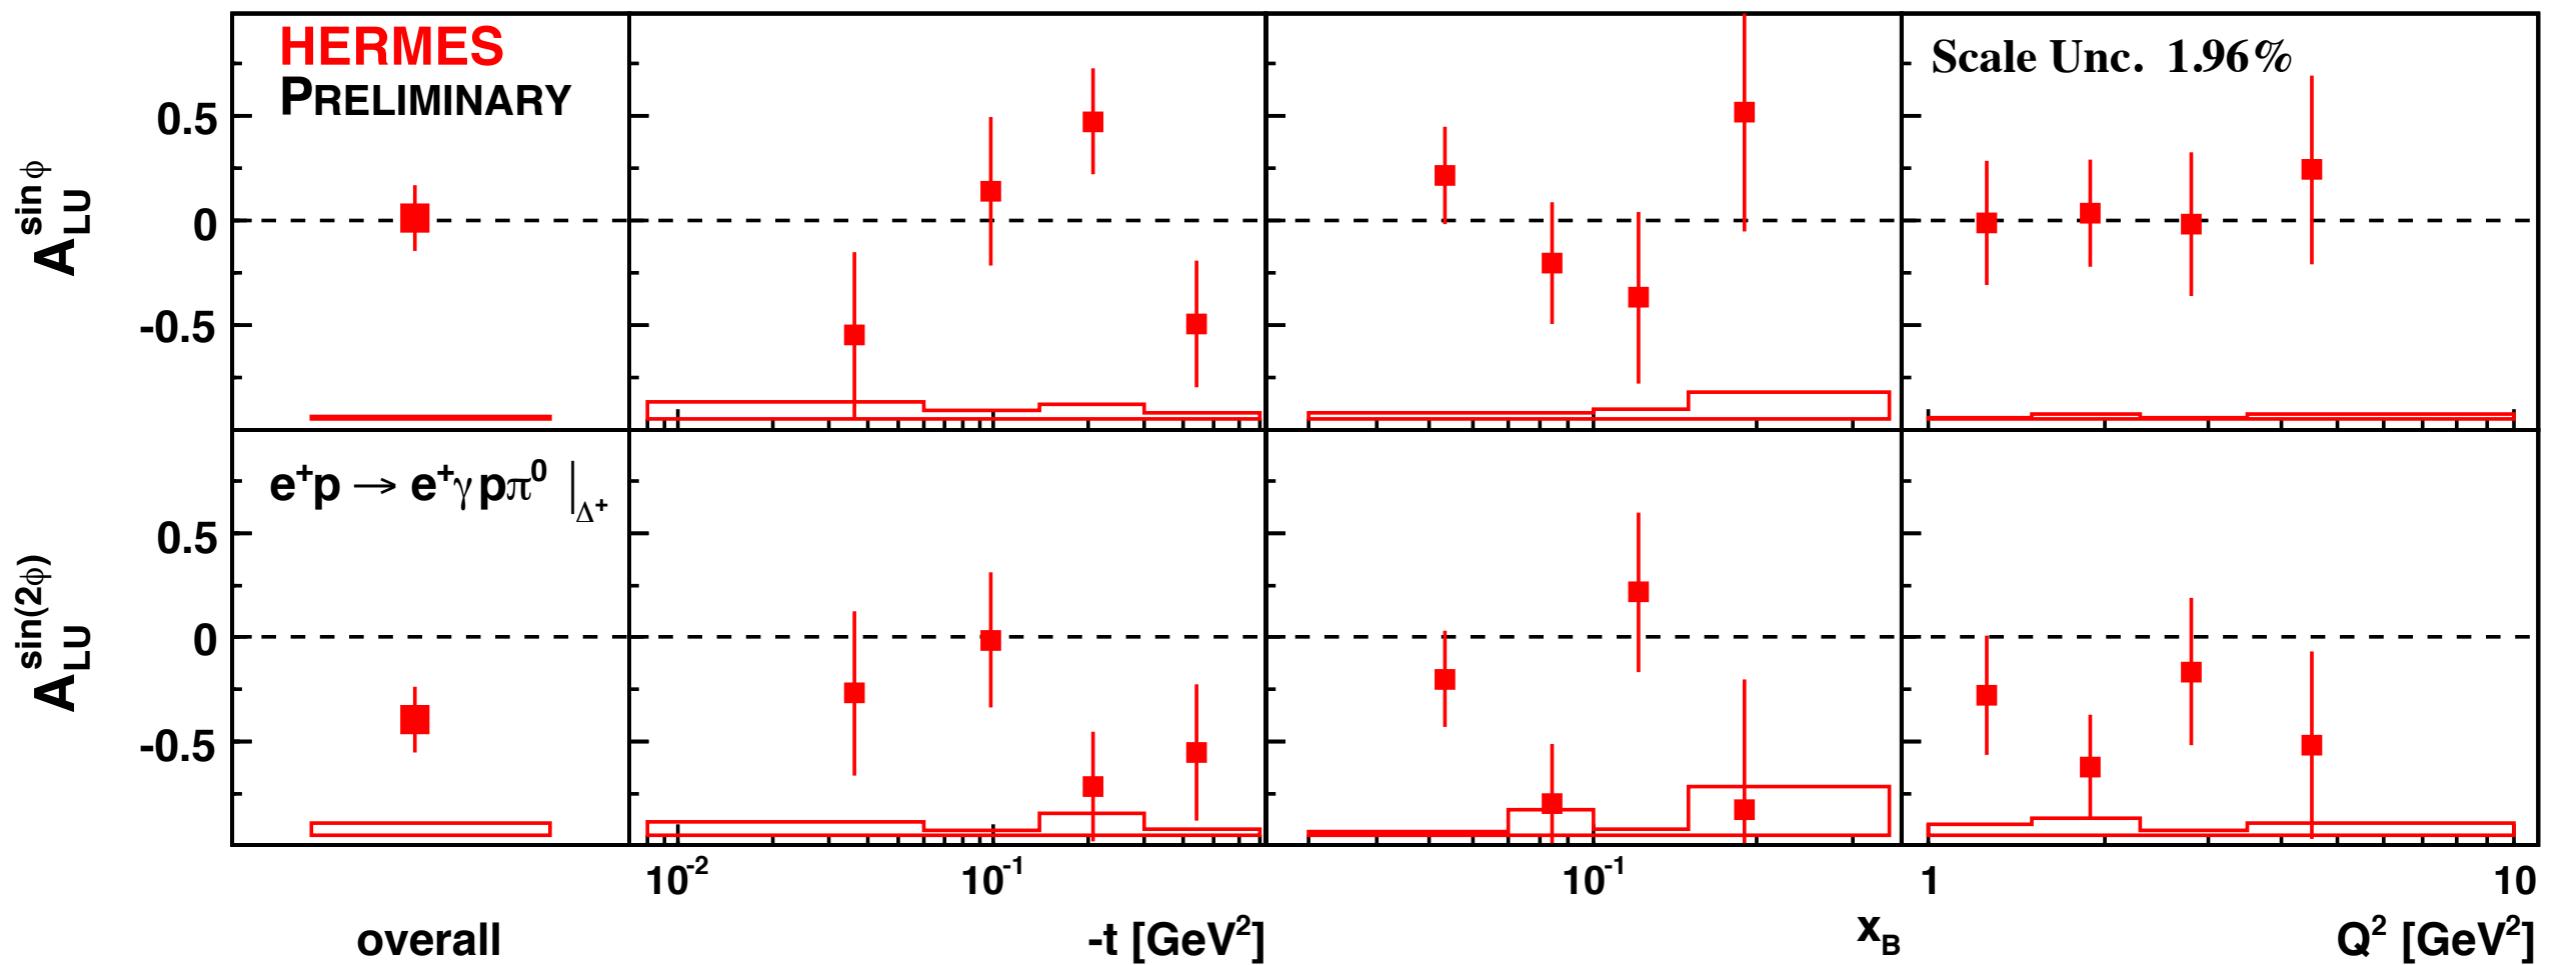

A. Airapetian *et al*, JHEP (*in press*)

<http://arxiv.org/abs/1206.5683>

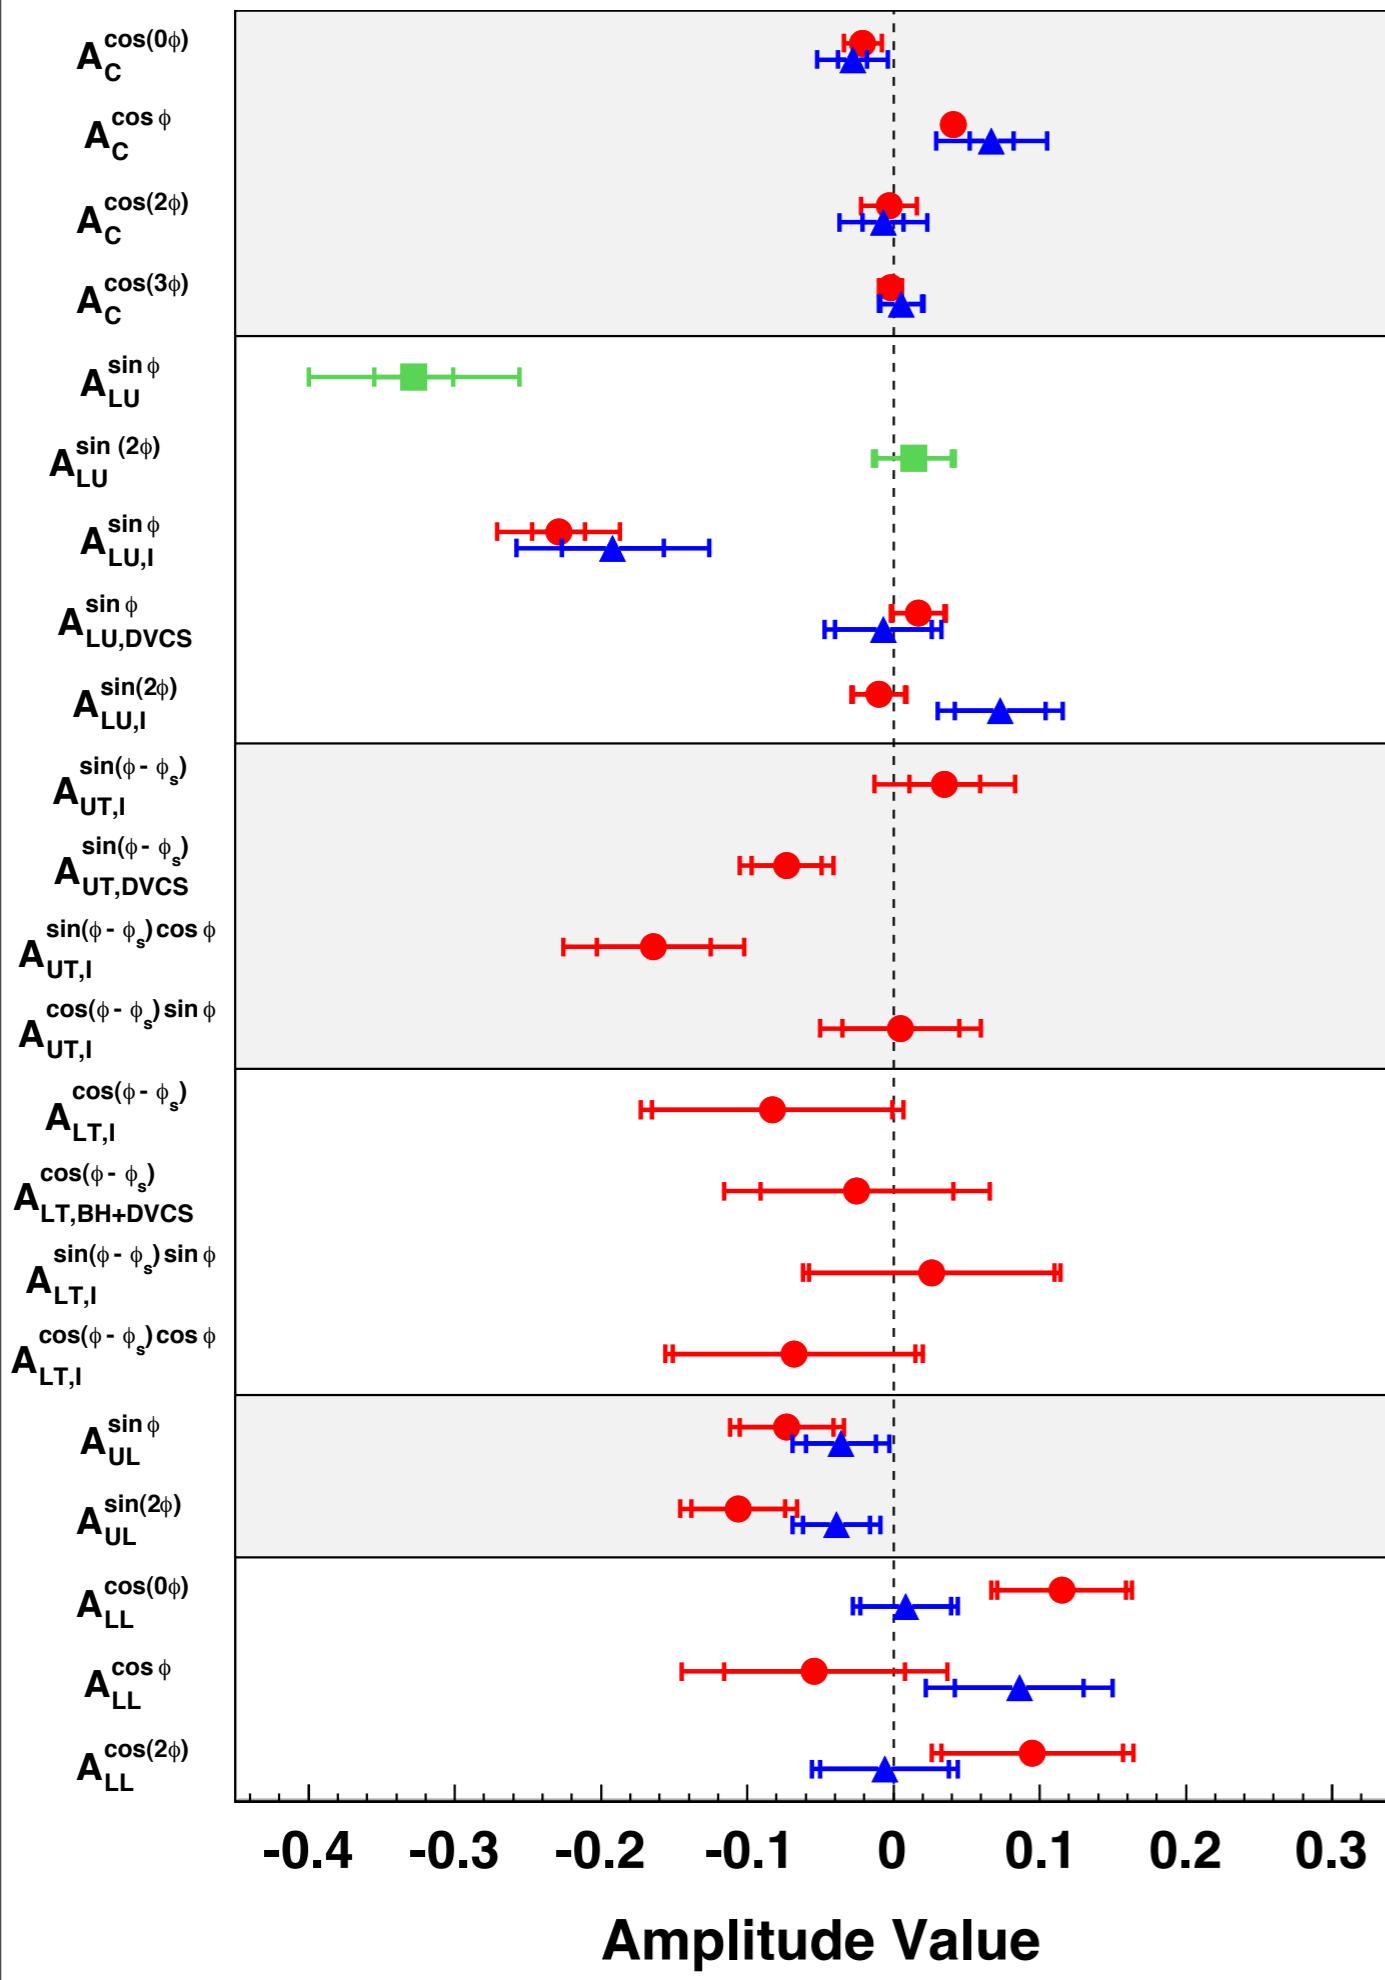

Fully reconstructed measurement of $\text{ep} \rightarrow \text{ep}\gamma$

Exclusive Measurement

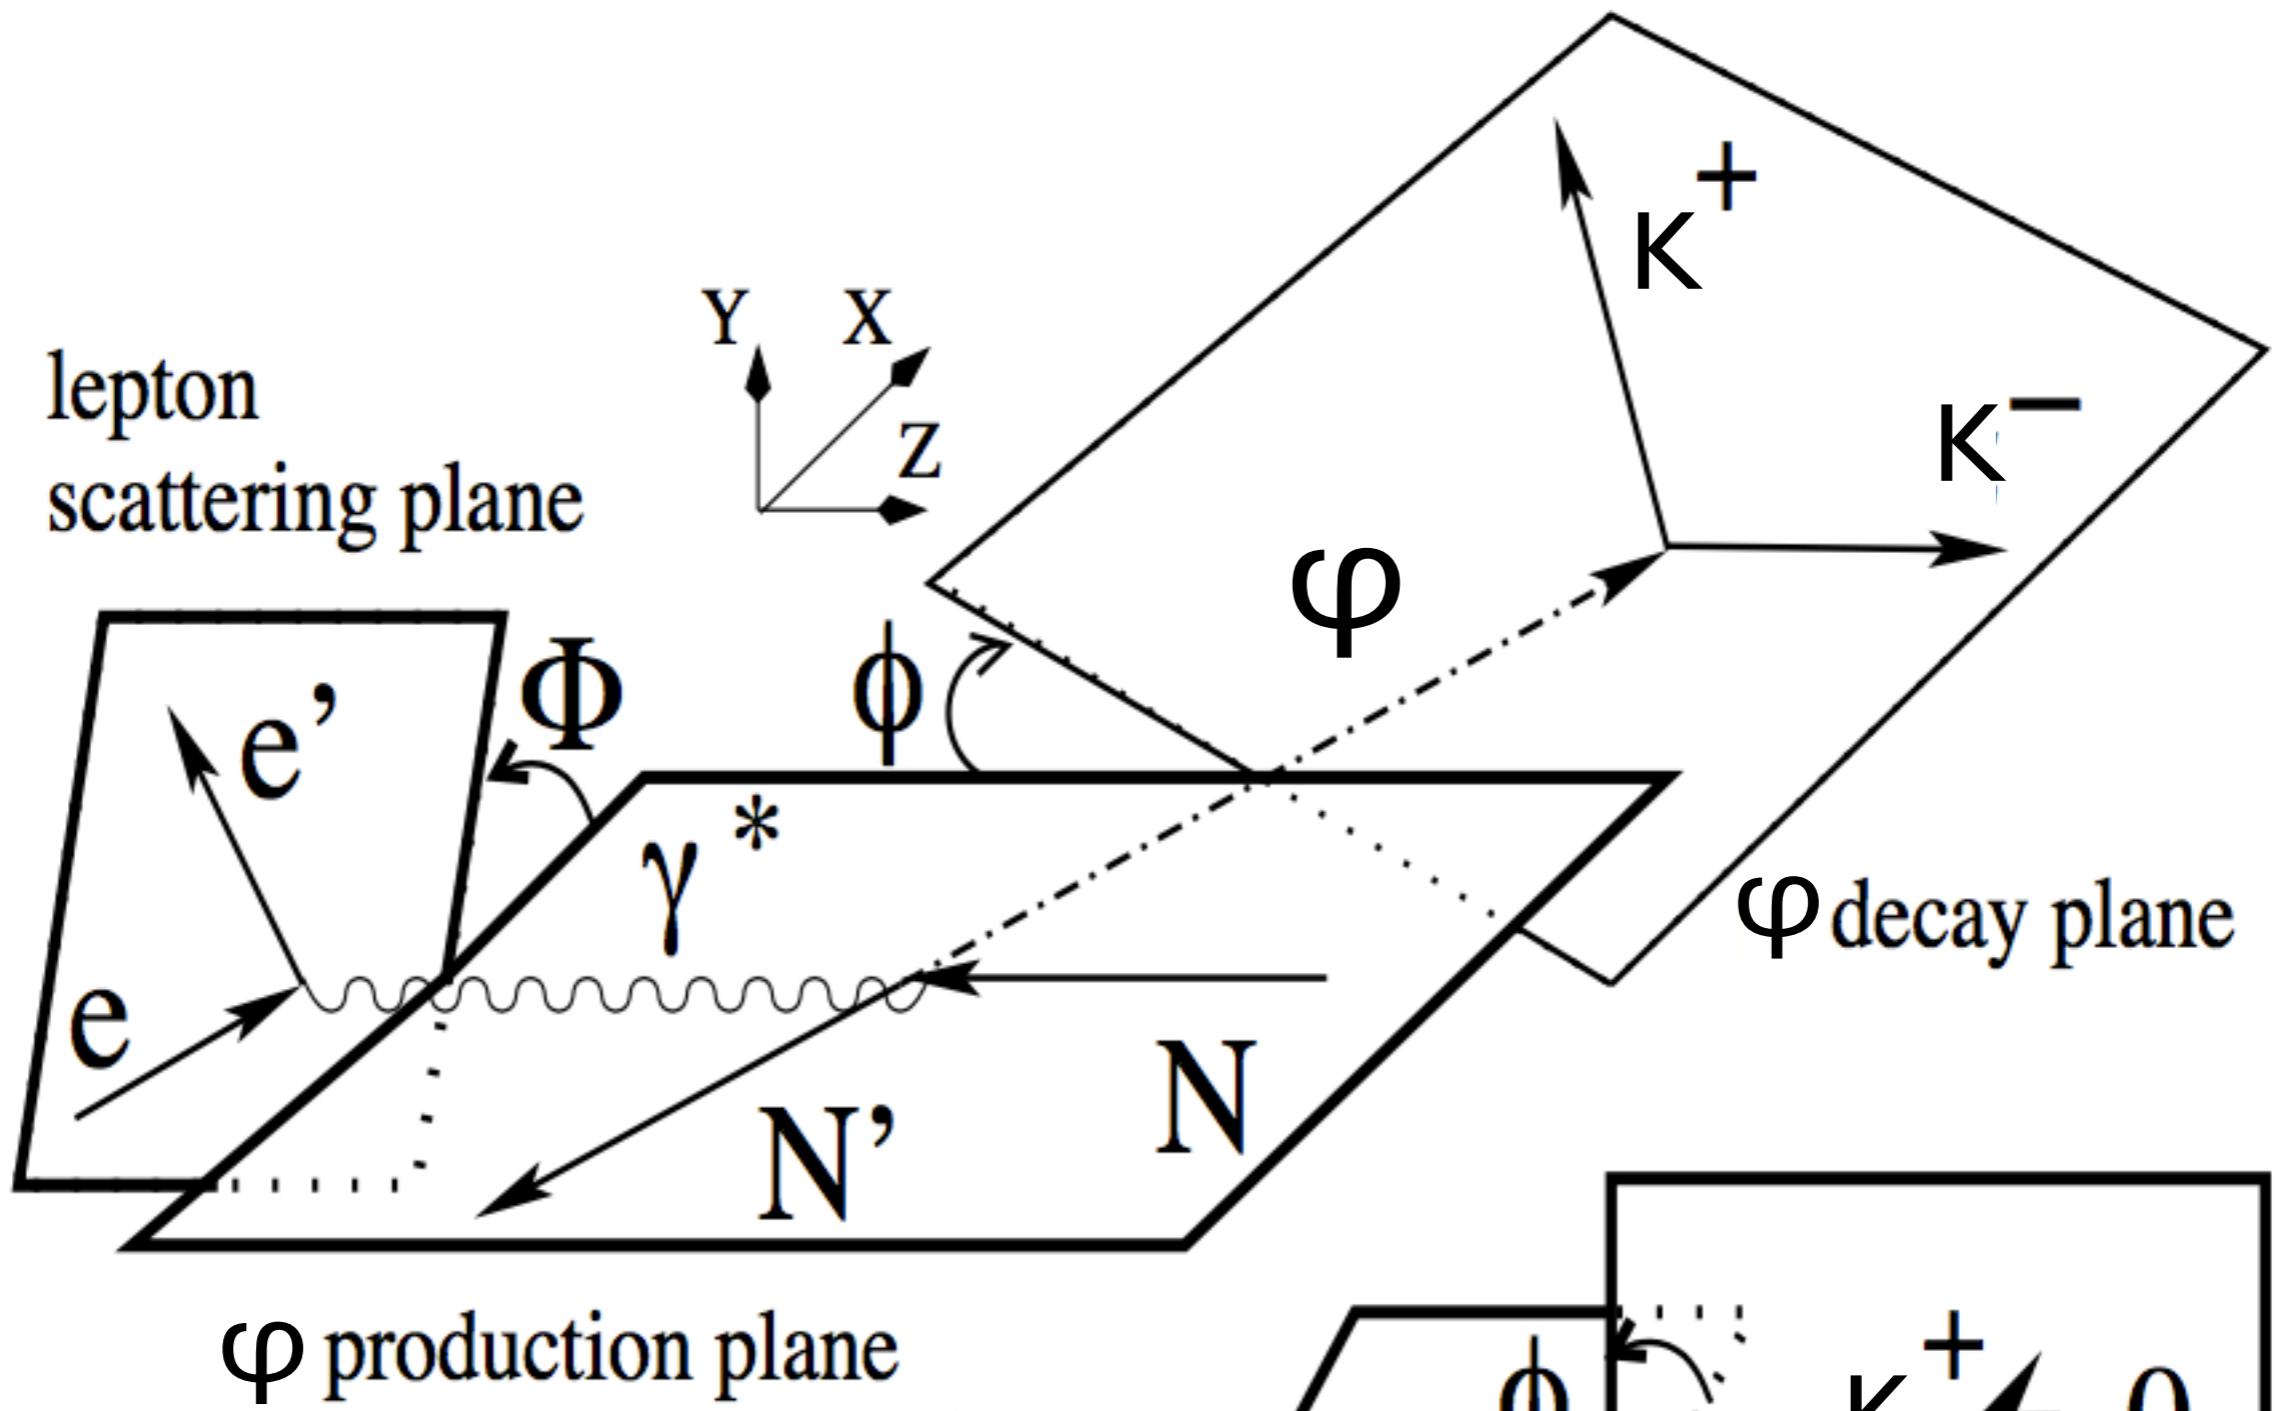

Results taken from measurement of $e p \rightarrow e p \pi^0 \gamma$

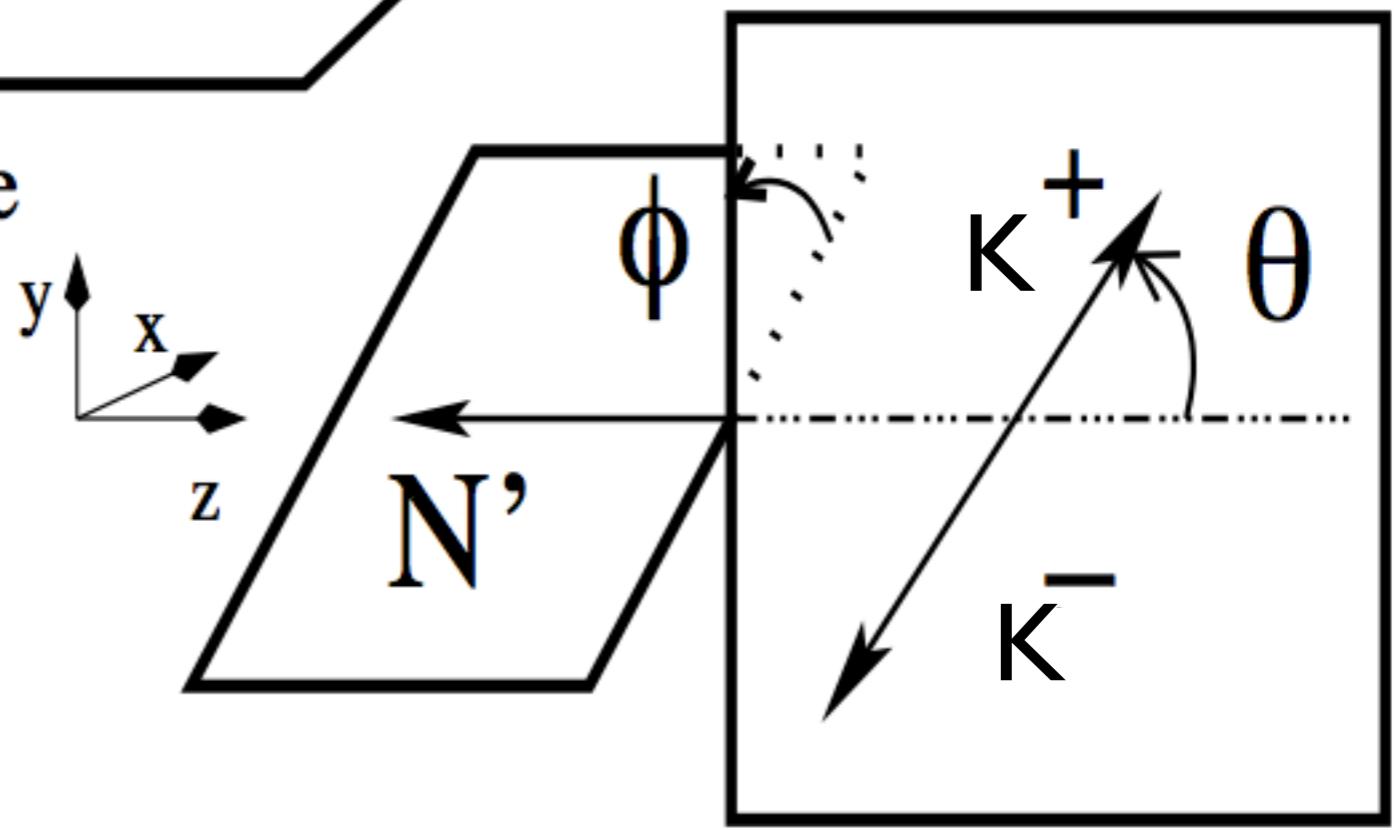

(Overall ‘zero’ asymmetry implies that the ‘associated’ fraction in the non-exclusive results acts as a dilution)

- DVCS remains the leading process for access to **Generalised Parton Distributions**
- HERMES has the most diverse DVCS measurements of any experiment.
- Polarised target experiments are **essential** for the extraction of GPDs; should be seen as a **fundamental experimental priority!**

Exclusive φ
Meson Production

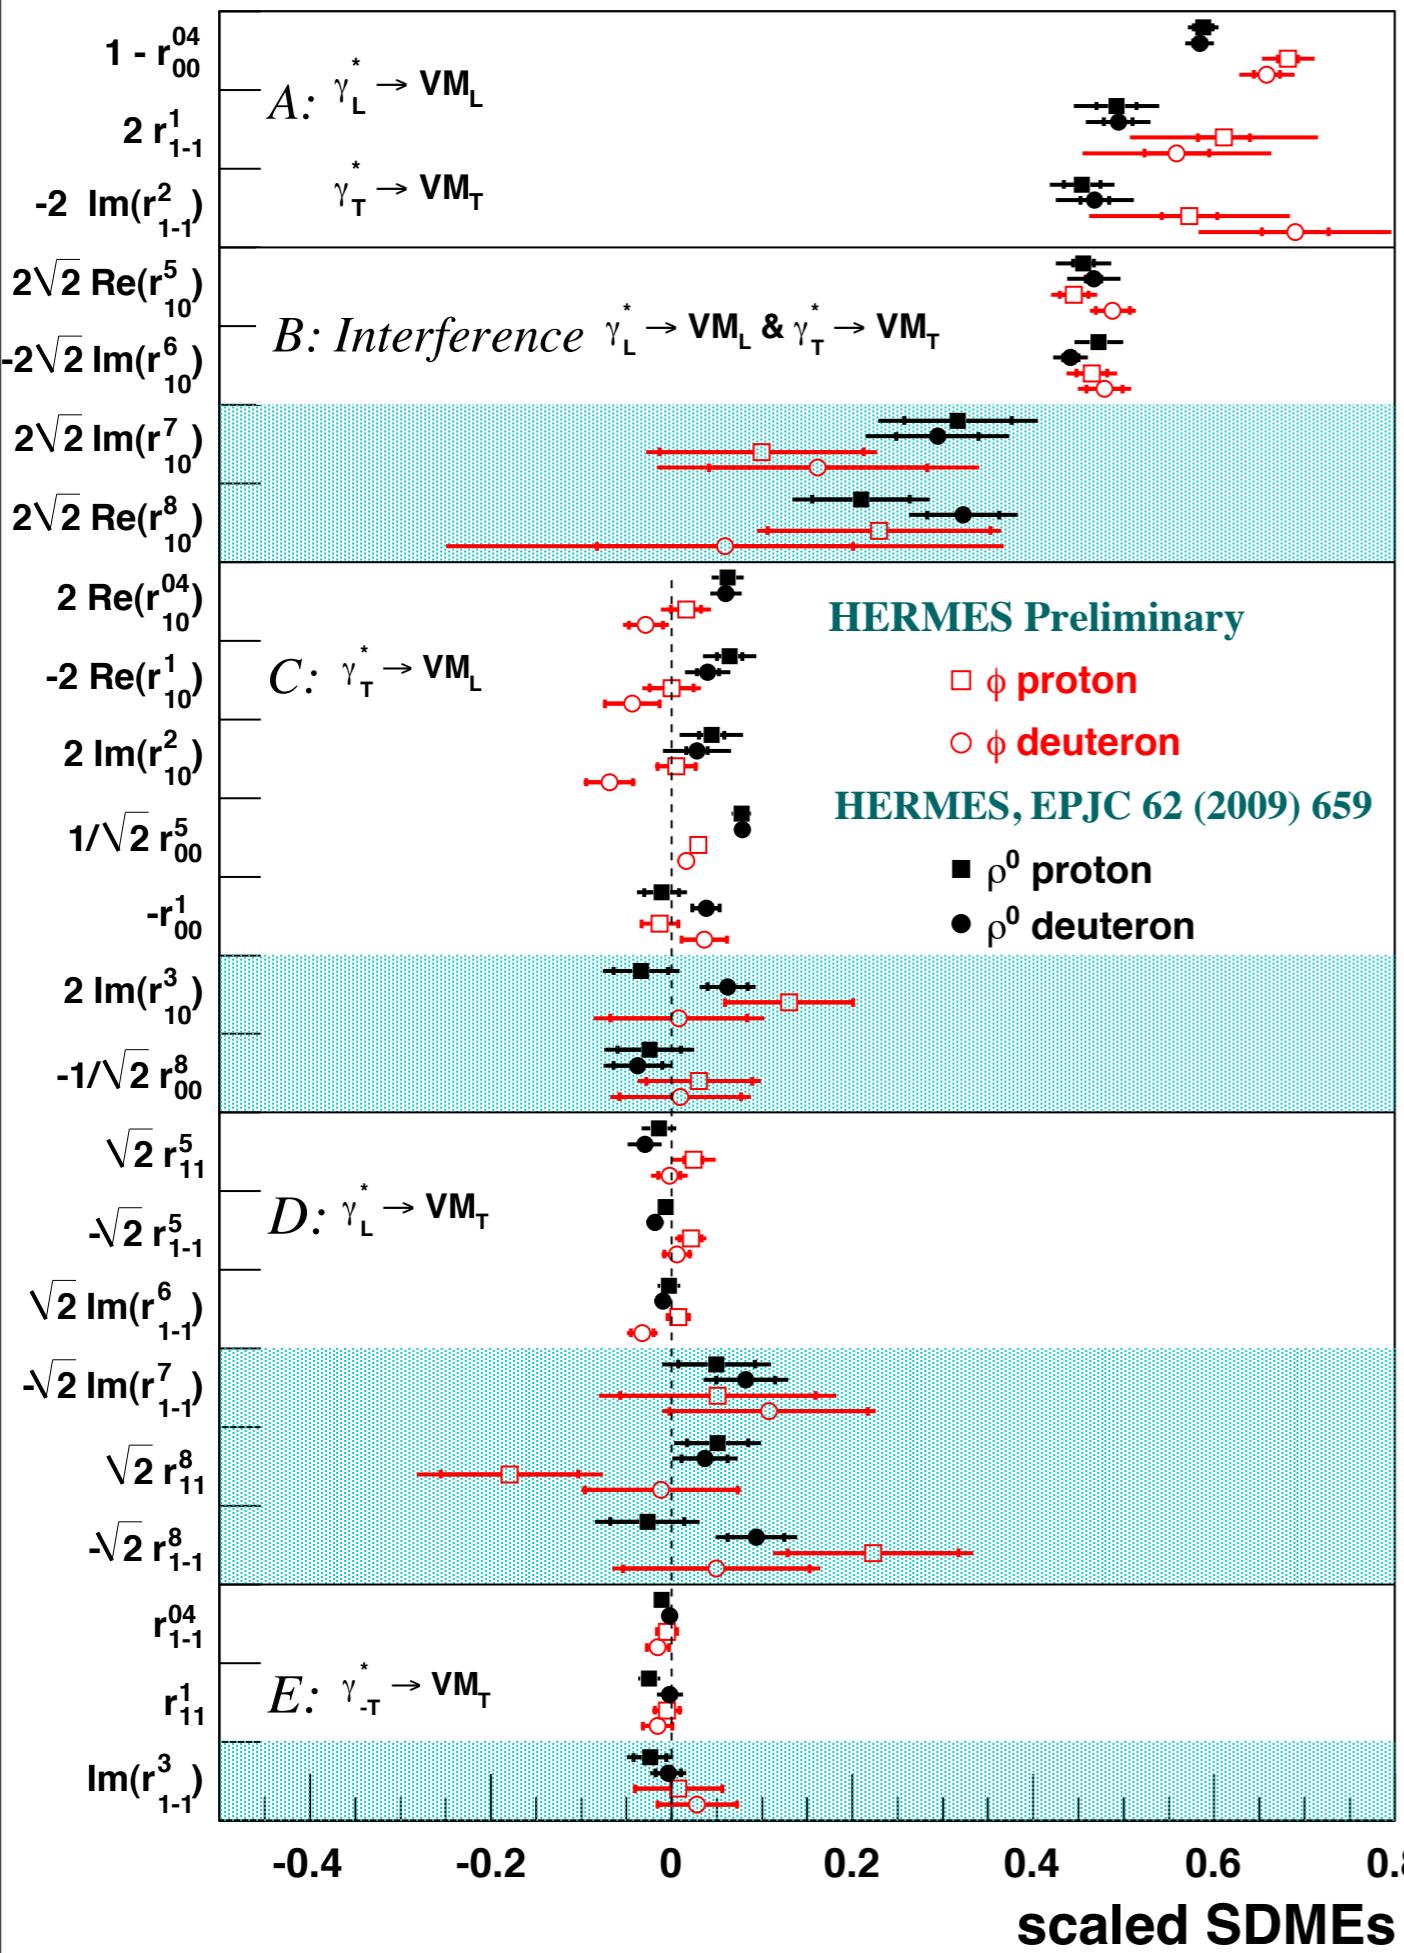

Exclusive Meson Production

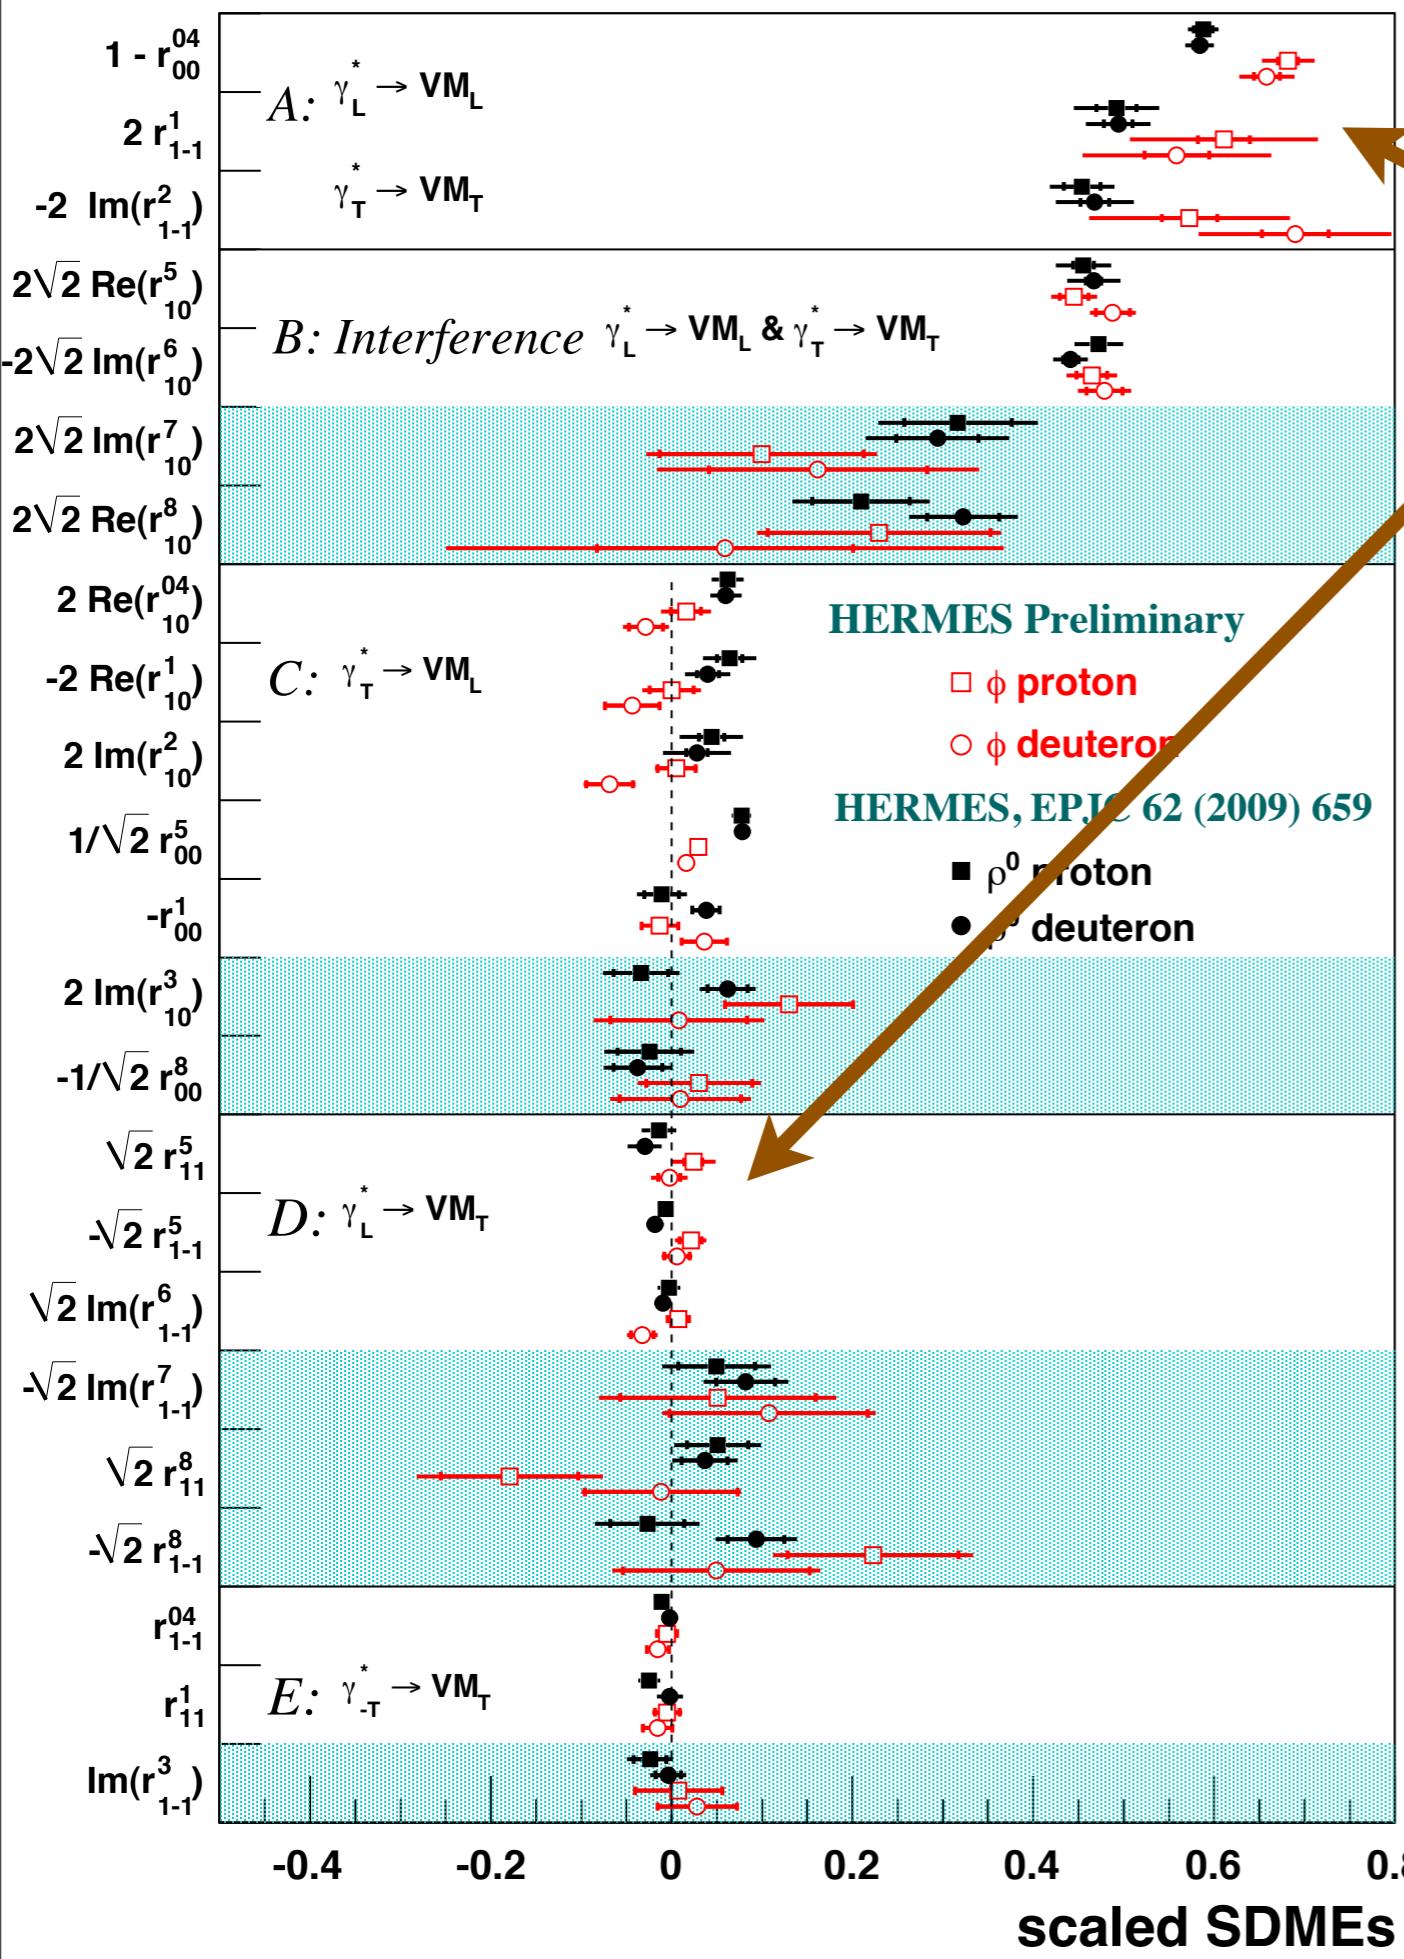

Results taken from measurement of $ep \rightarrow eX\varphi$.

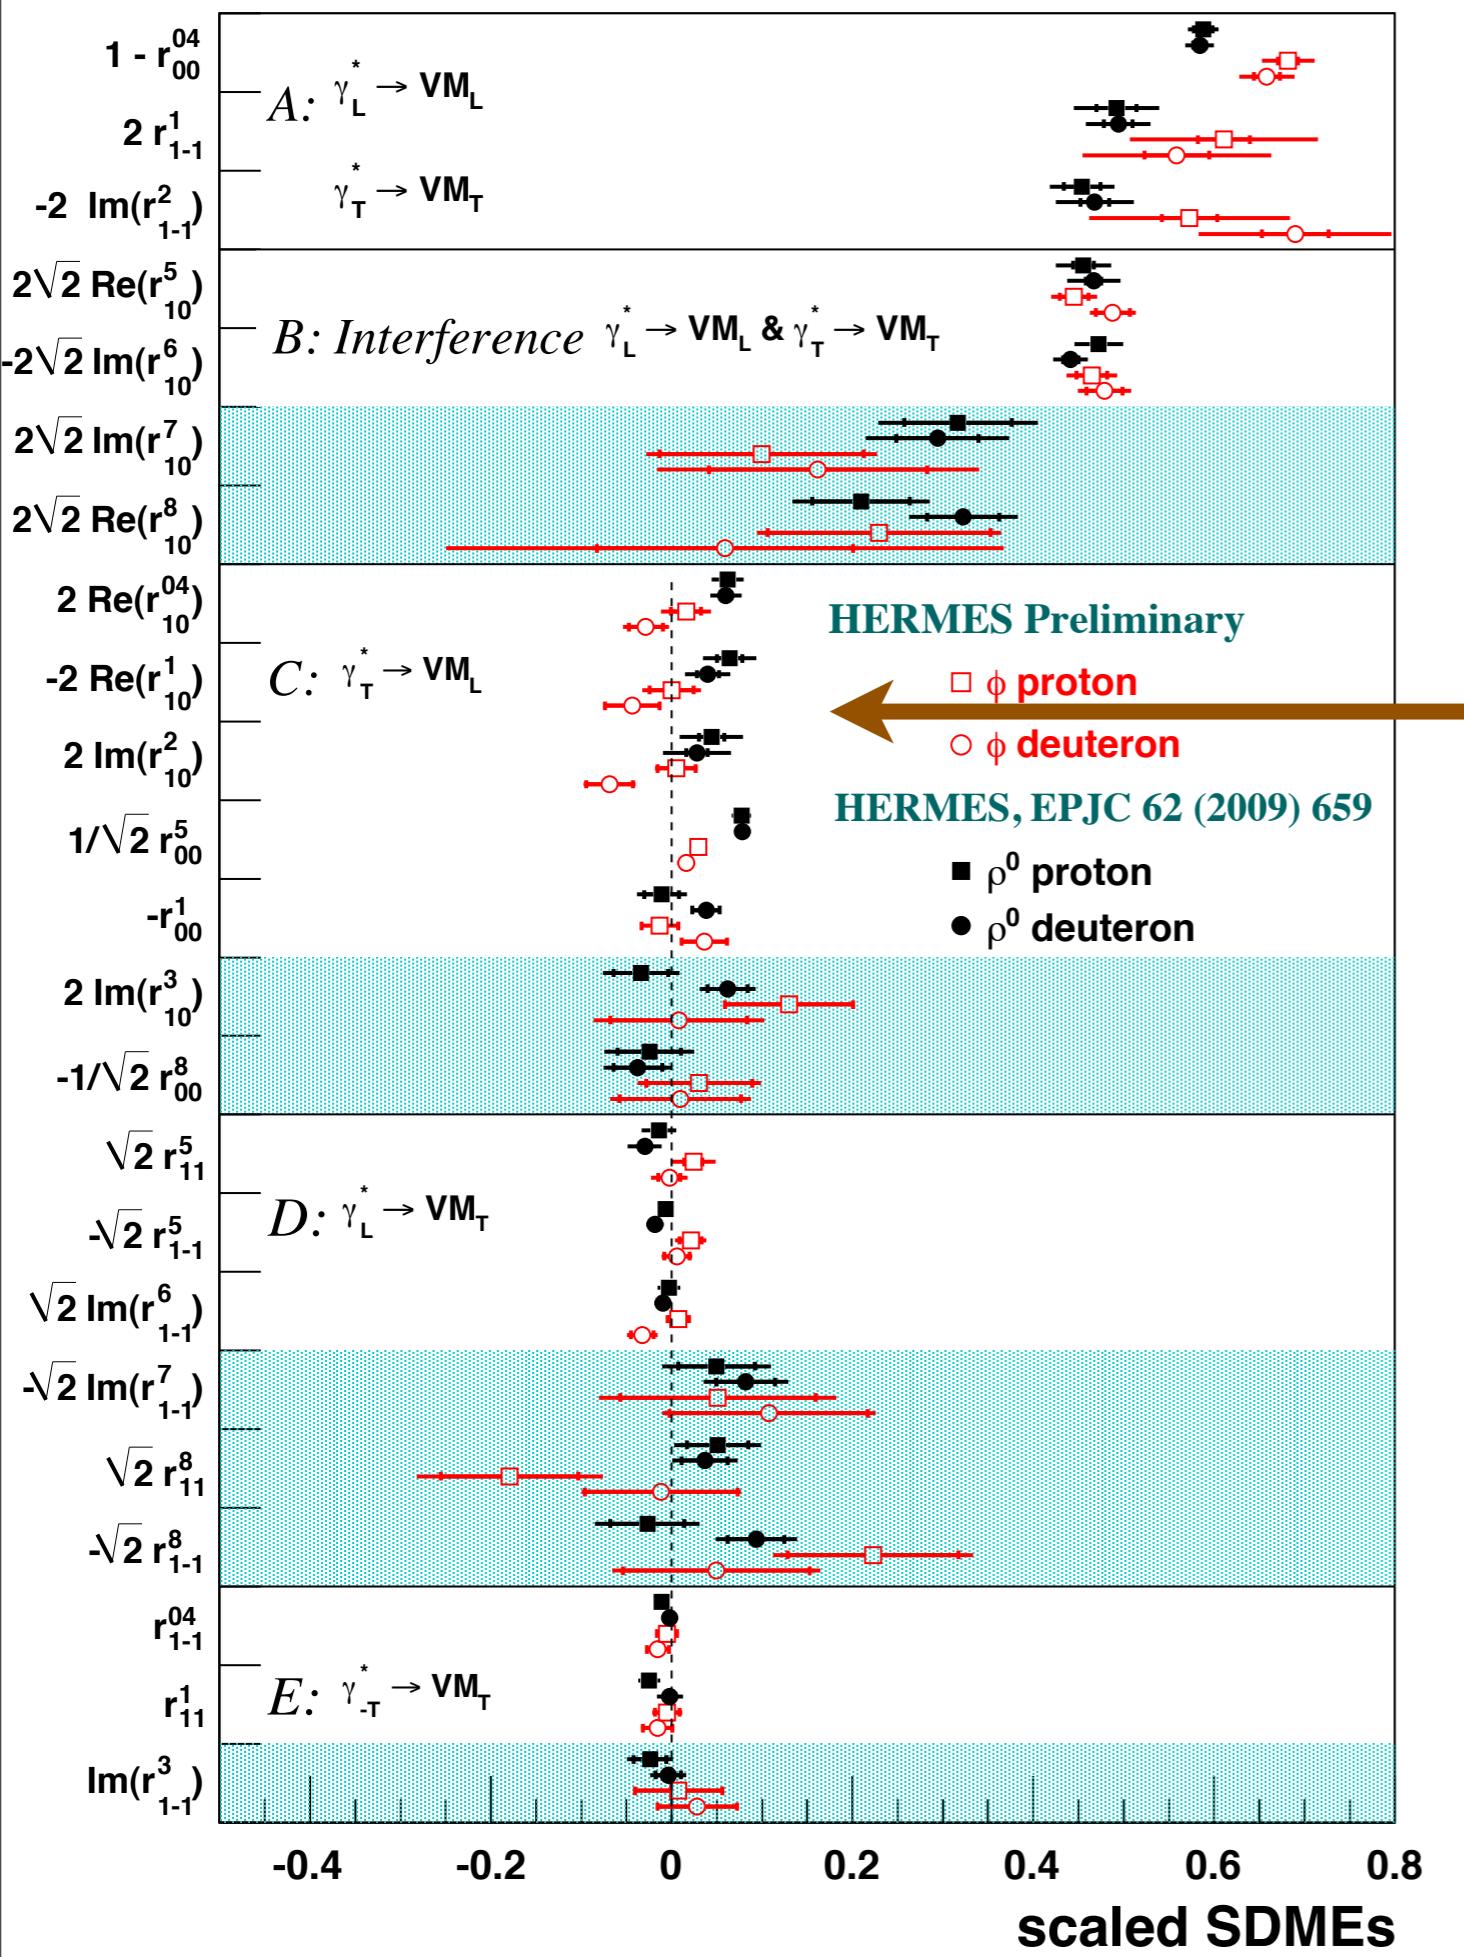

No measured distinction between proton and deuteron data.

Leading-twist transitions are typically larger than the ρ^0 -equivalent.

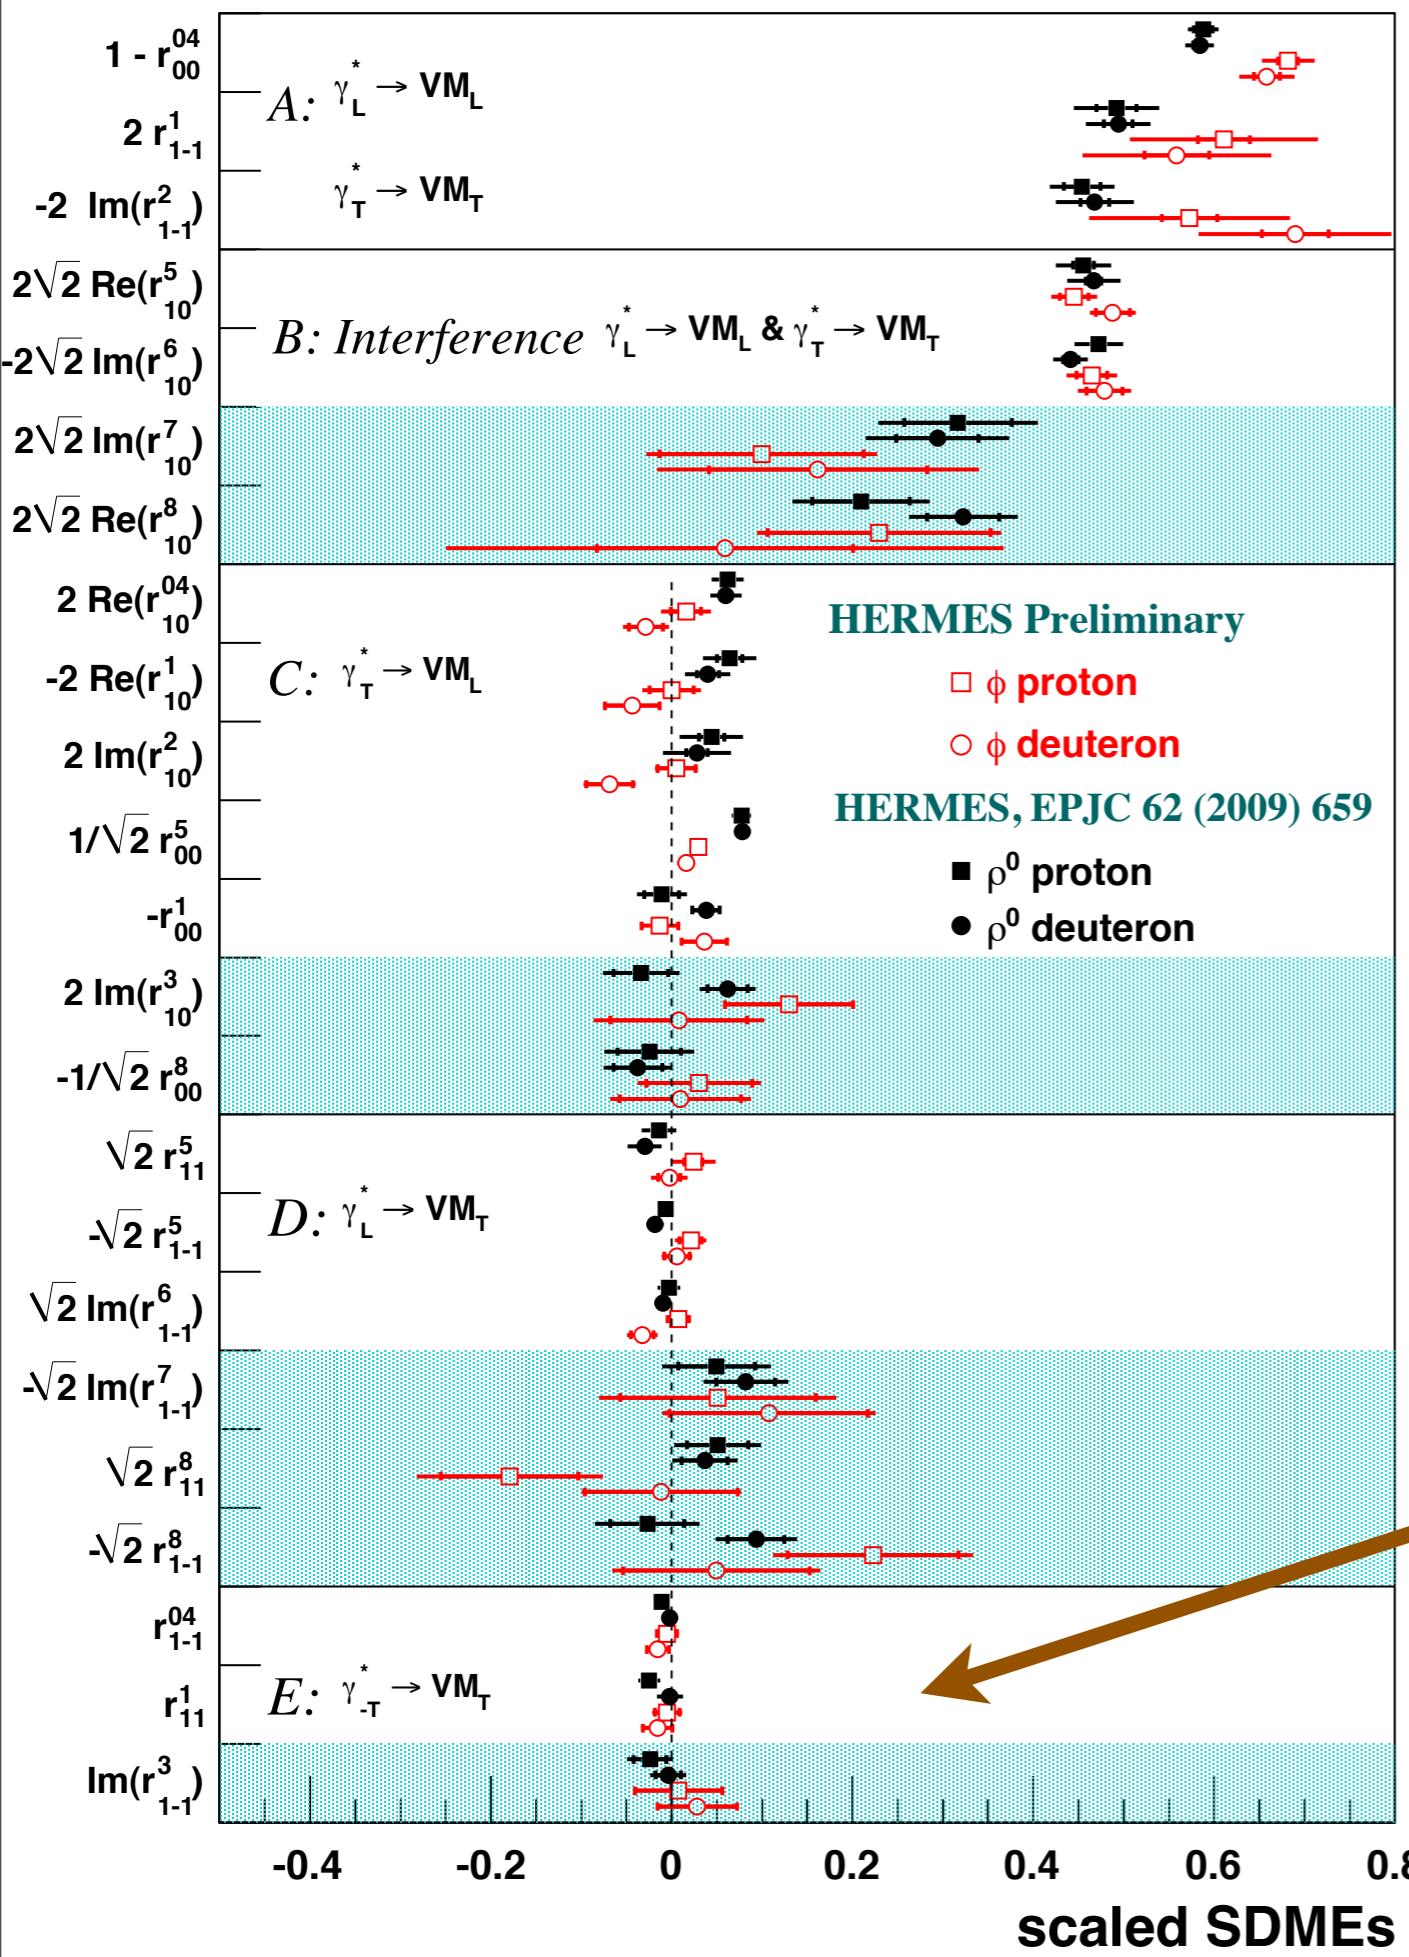

Longitudinal photons
mostly produce
longitudinal mesons

Longitudinal photons
mostly produce
longitudinal mesons

Some small indication
that transverse photons
can produce longitudinal
mesons

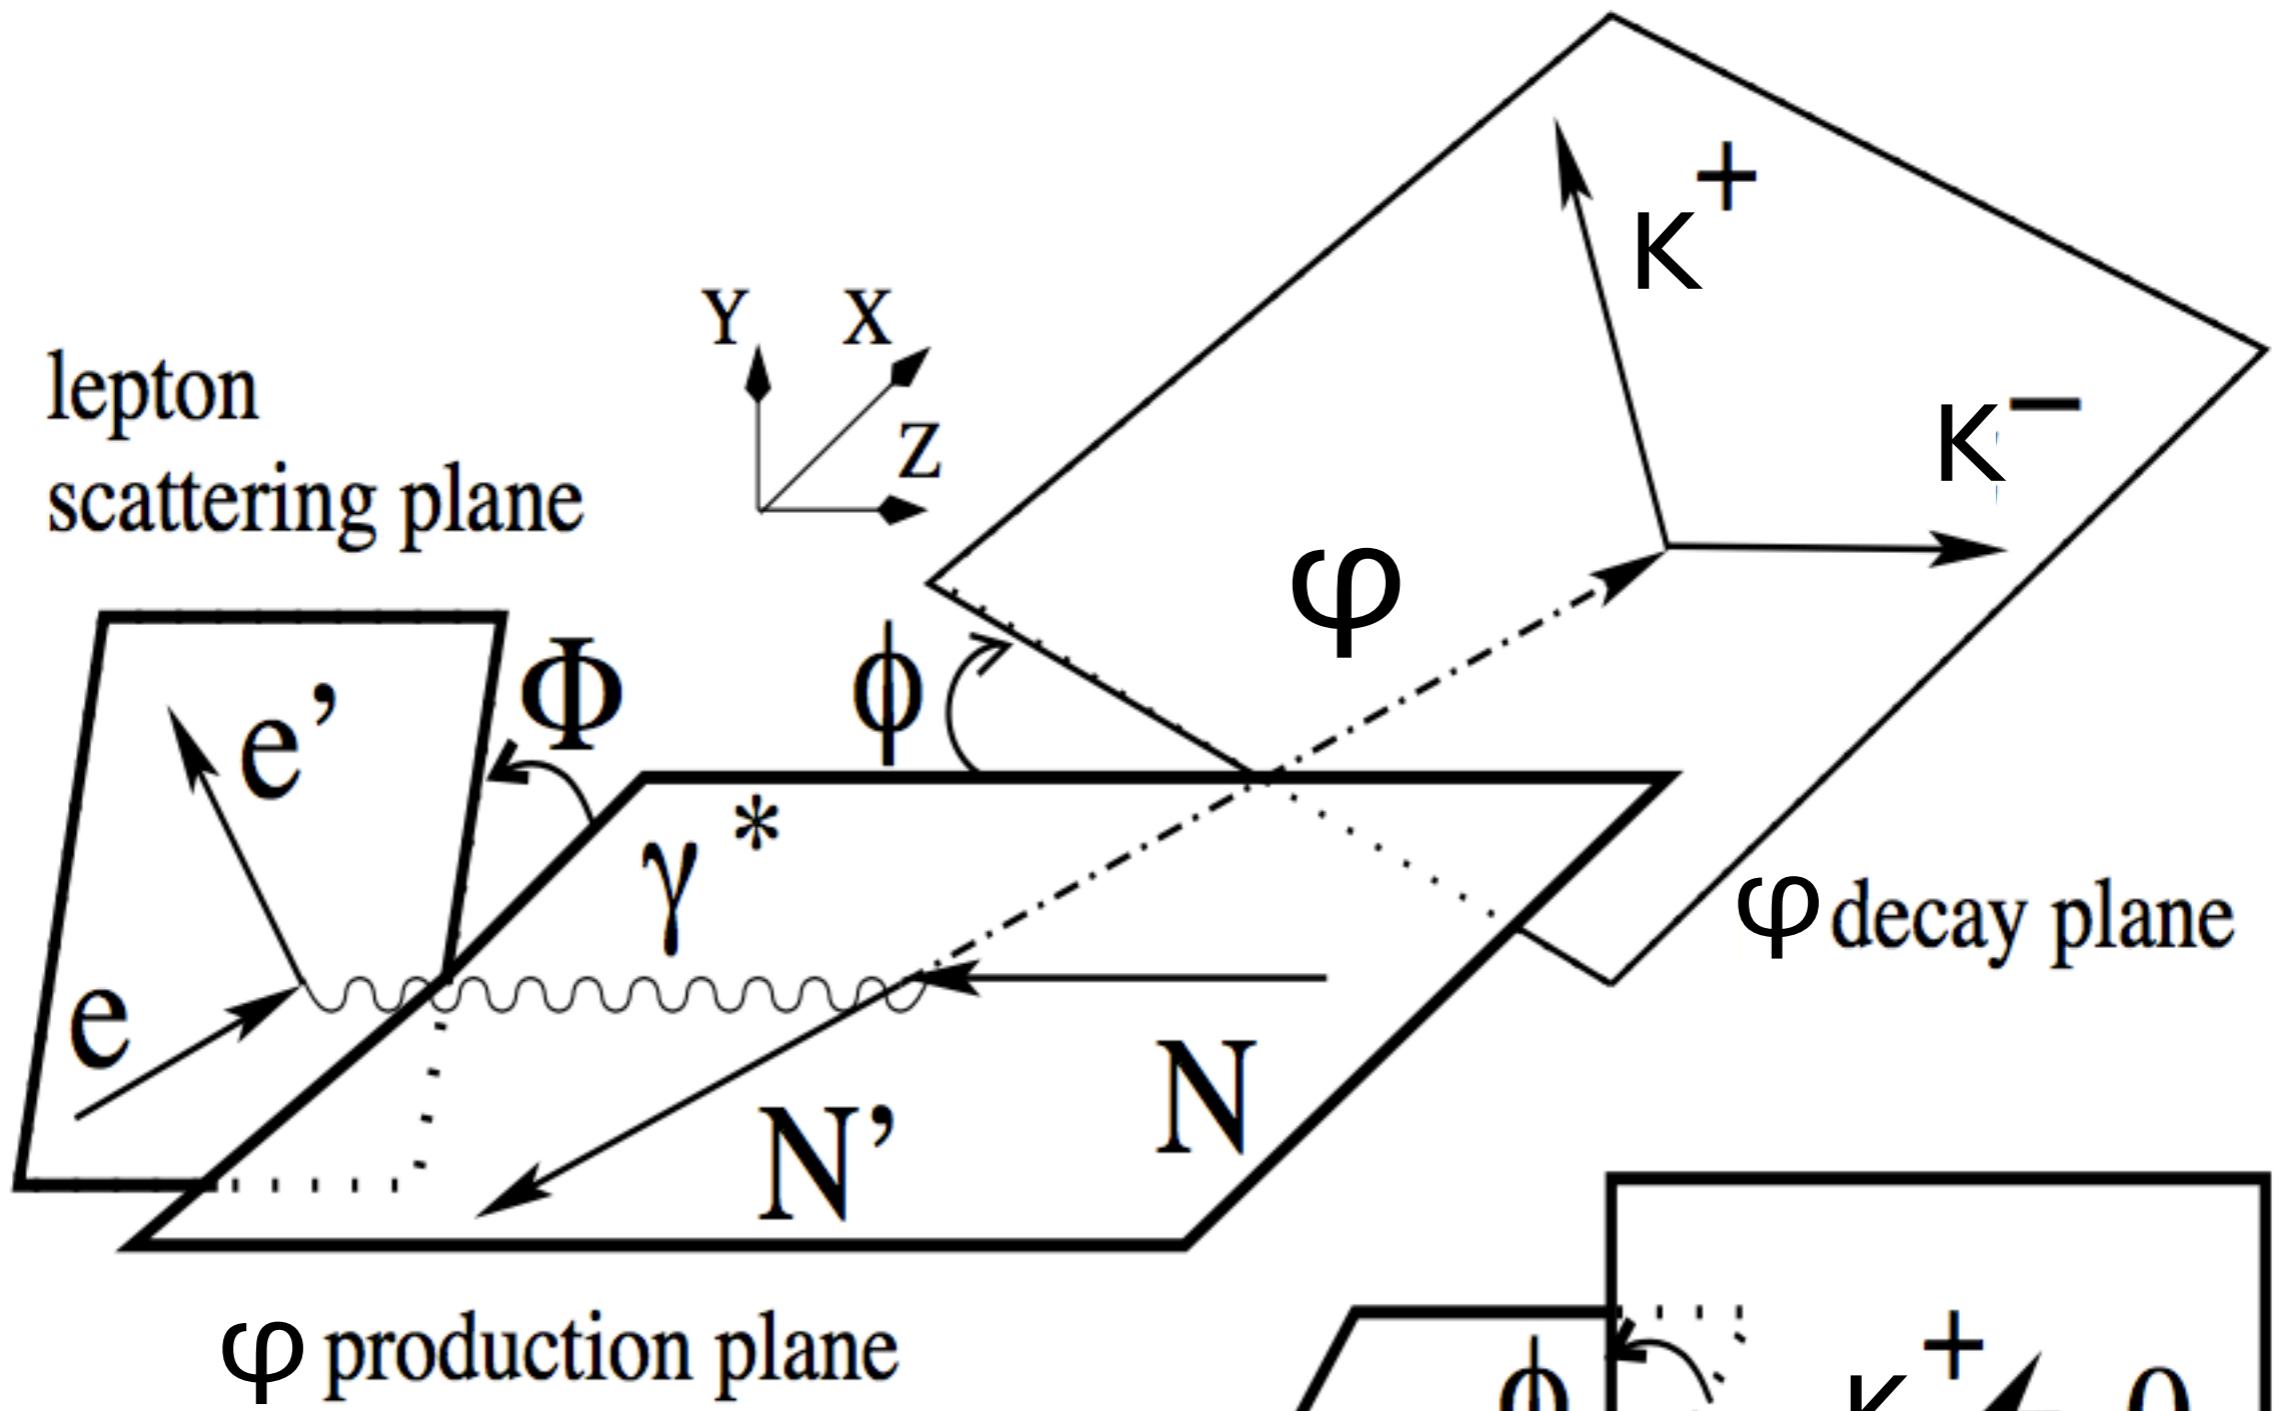

Longitudinal photons mostly produce longitudinal mesons

Some small indication that transverse photons can produce longitudinal mesons

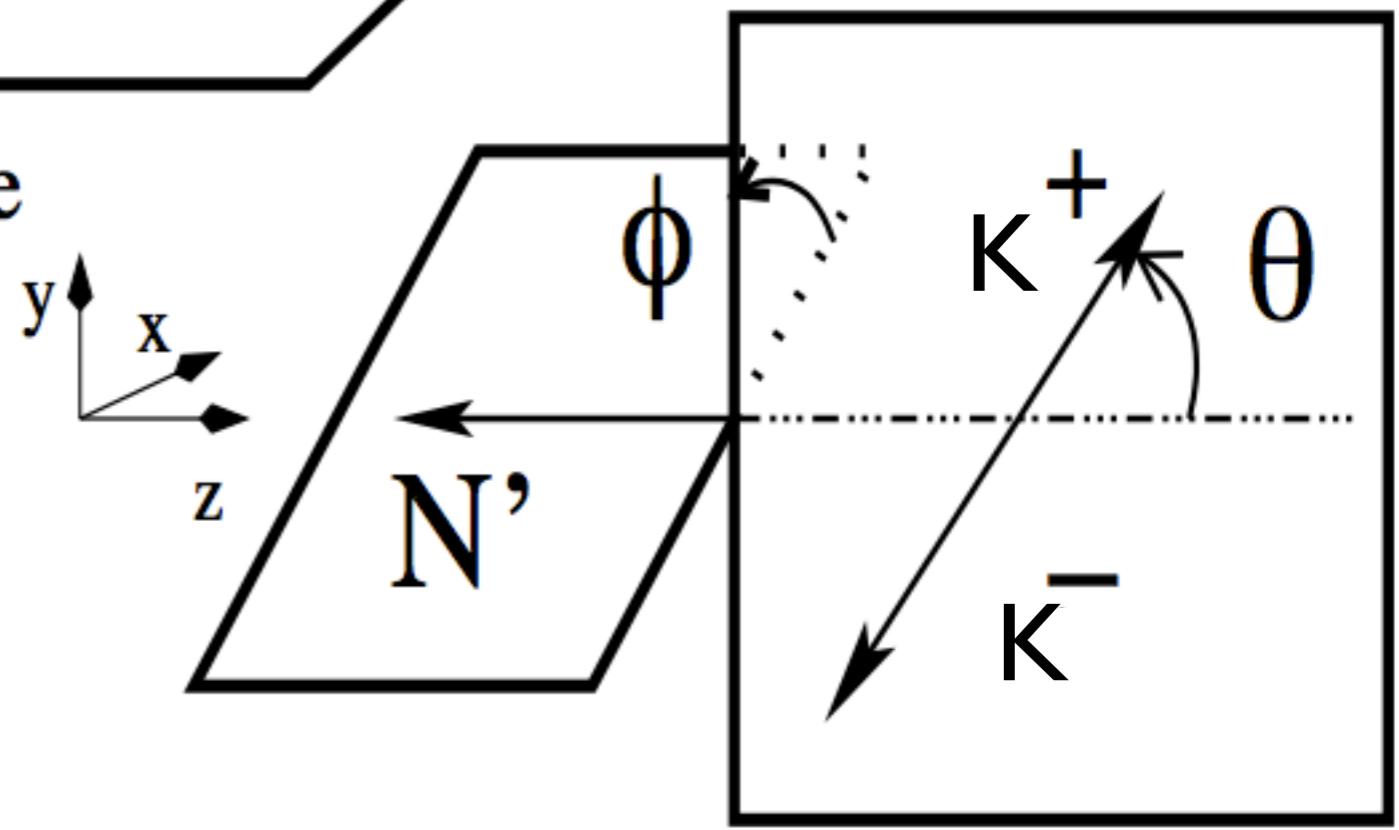

Zero indication of two units of angular momentum change (-T γ makes +T φ)

Physics Update from HERMES

- New inclusive measurement of g_2 and A_2 released, compatible with SLAC and SMC.
- HERMES has very diverse DVCS measurements available - programme almost complete.
- Exclusive meson results also available; φ SDMEs seem mostly to match ρ^0 SDMEs.

Exclusive φ
Meson Production

Angular Distribution

$$W^{U+L}(\Phi, \phi, \cos\theta) = W^{UU}(\Phi, \phi, \cos\theta) + W^{LU}(\Phi, \phi, \cos\theta)$$

For unpolarized target and beam:

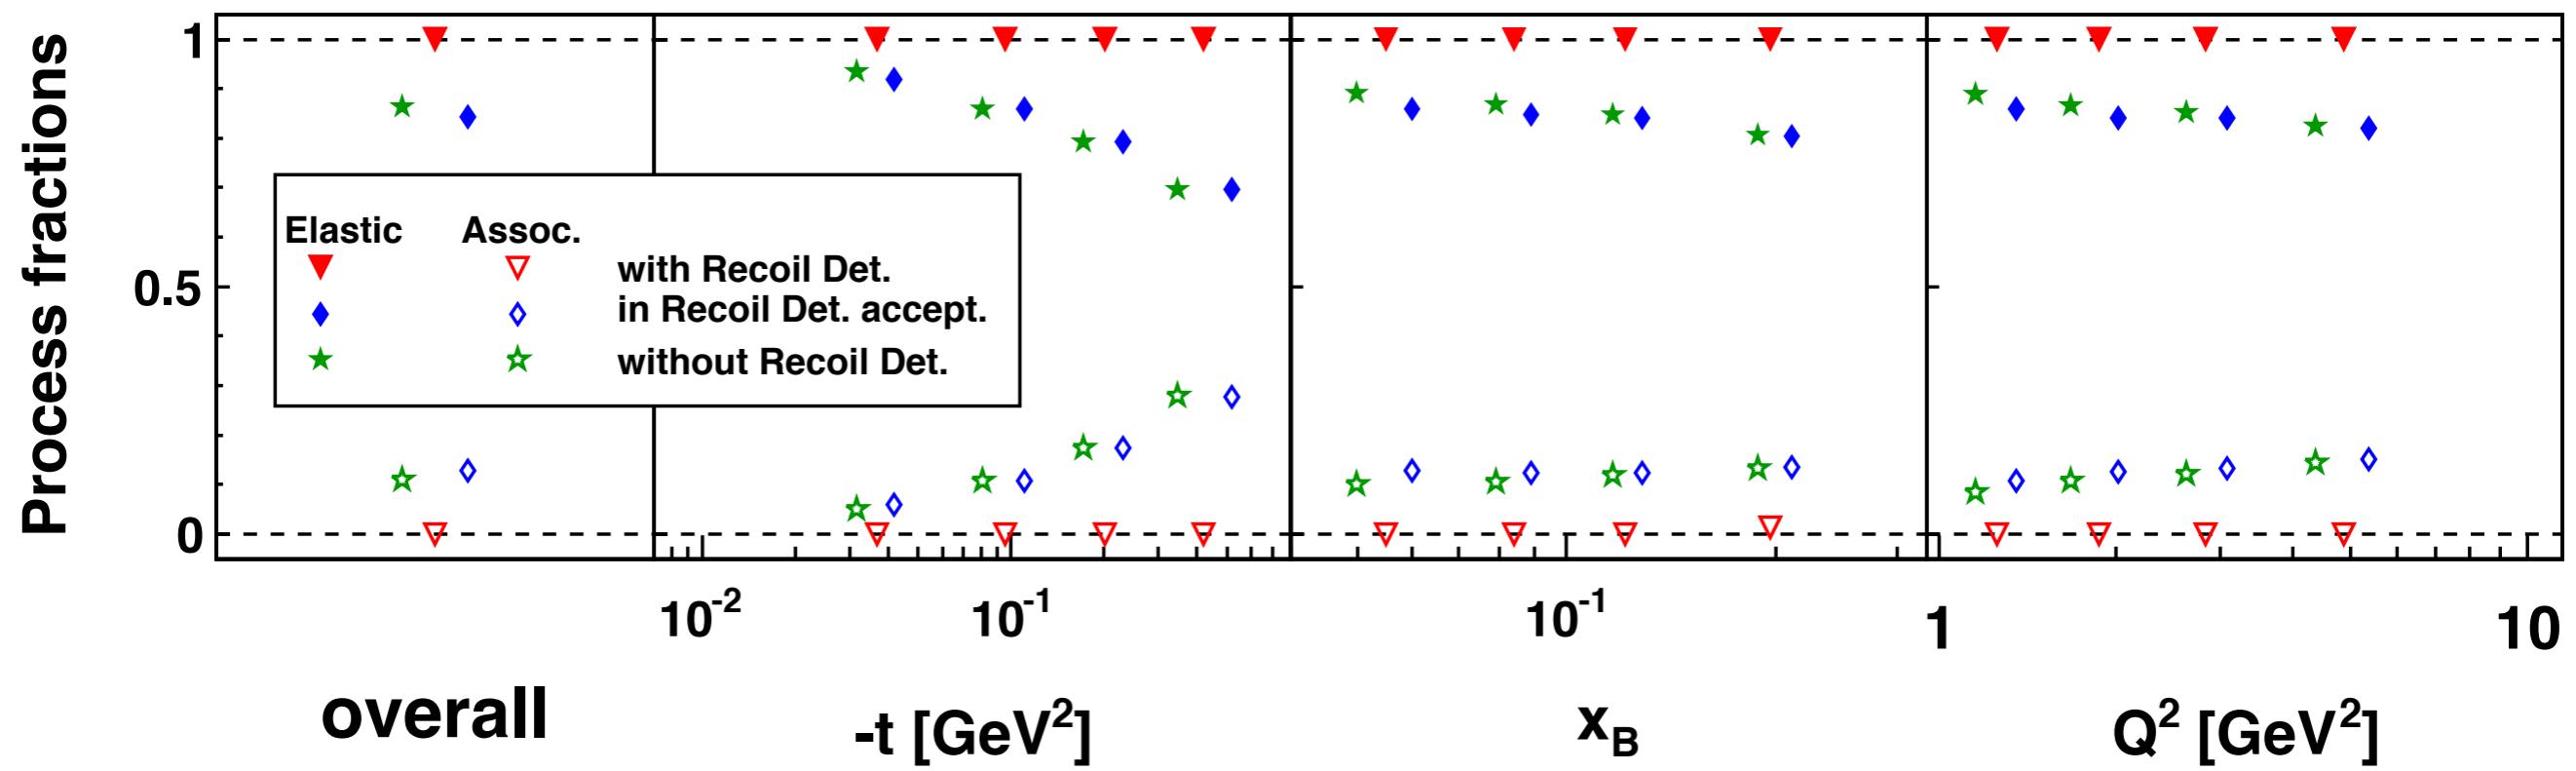

$$\begin{aligned} W^{UU}(\Phi, \phi, \cos\theta) = & \frac{3}{8\pi^2} \left[\frac{1}{2} \left(1 - \textcolor{red}{r}_{00}^{04} \right) + \frac{1}{2} \left(3 \textcolor{red}{r}_{00}^{04} - 1 \right) \cos^2 \theta - \sqrt{2} \operatorname{Re} \left\{ r_{10}^{04} \right\} \sin 2\theta \cos \phi - \textcolor{red}{r}_{1-1}^{04} \sin^2 \theta \cos 2\phi \right. \\ & - \varepsilon \cos 2\Phi \left(\textcolor{red}{r}_{11}^1 \sin^2 \theta + \textcolor{red}{r}_{00}^1 \cos^2 \theta - \sqrt{2} \operatorname{Re} \left\{ r_{10}^1 \right\} \sin 2\theta \cos \phi - \textcolor{red}{r}_{1-1}^1 \sin^2 \theta \cos 2\phi \right) \\ & - \varepsilon \sin 2\Phi \left(\sqrt{2} \operatorname{Im} \left\{ r_{10}^2 \right\} \sin 2\theta \sin \phi + \operatorname{Im} \left\{ r_{1-1}^2 \right\} \sin^2 \theta \sin 2\phi \right) \\ & + \sqrt{2\varepsilon(1+\varepsilon)} \cos \Phi \left(\textcolor{red}{r}_{11}^5 \sin^2 \theta + \textcolor{red}{r}_{00}^5 \cos^2 \theta - \sqrt{2} \operatorname{Re} \left\{ r_{10}^5 \right\} \sin 2\theta \cos \phi - \textcolor{red}{r}_{1-1}^5 \sin^2 \theta \cos 2\phi \right) \\ & \left. + \sqrt{2\varepsilon(1+\varepsilon)} \sin \Phi \left(\sqrt{2} \operatorname{Im} \left\{ r_{10}^6 \right\} \sin 2\theta \sin \phi + \operatorname{Im} \left\{ r_{1-1}^6 \right\} \sin^2 \theta \sin 2\phi \right) \right] \end{aligned}$$

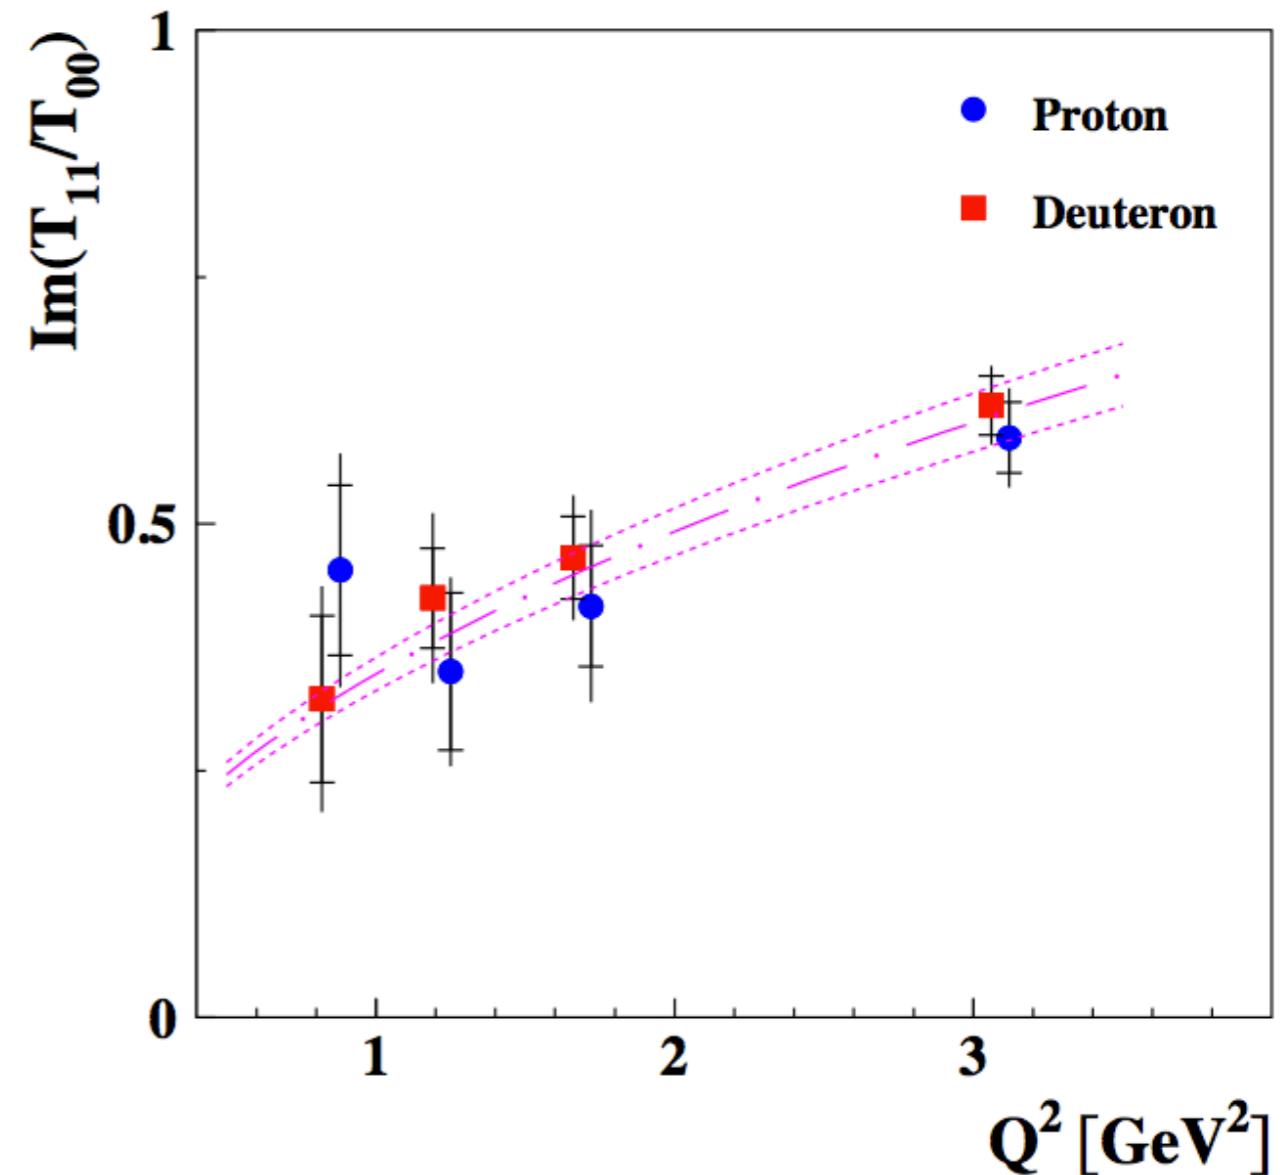

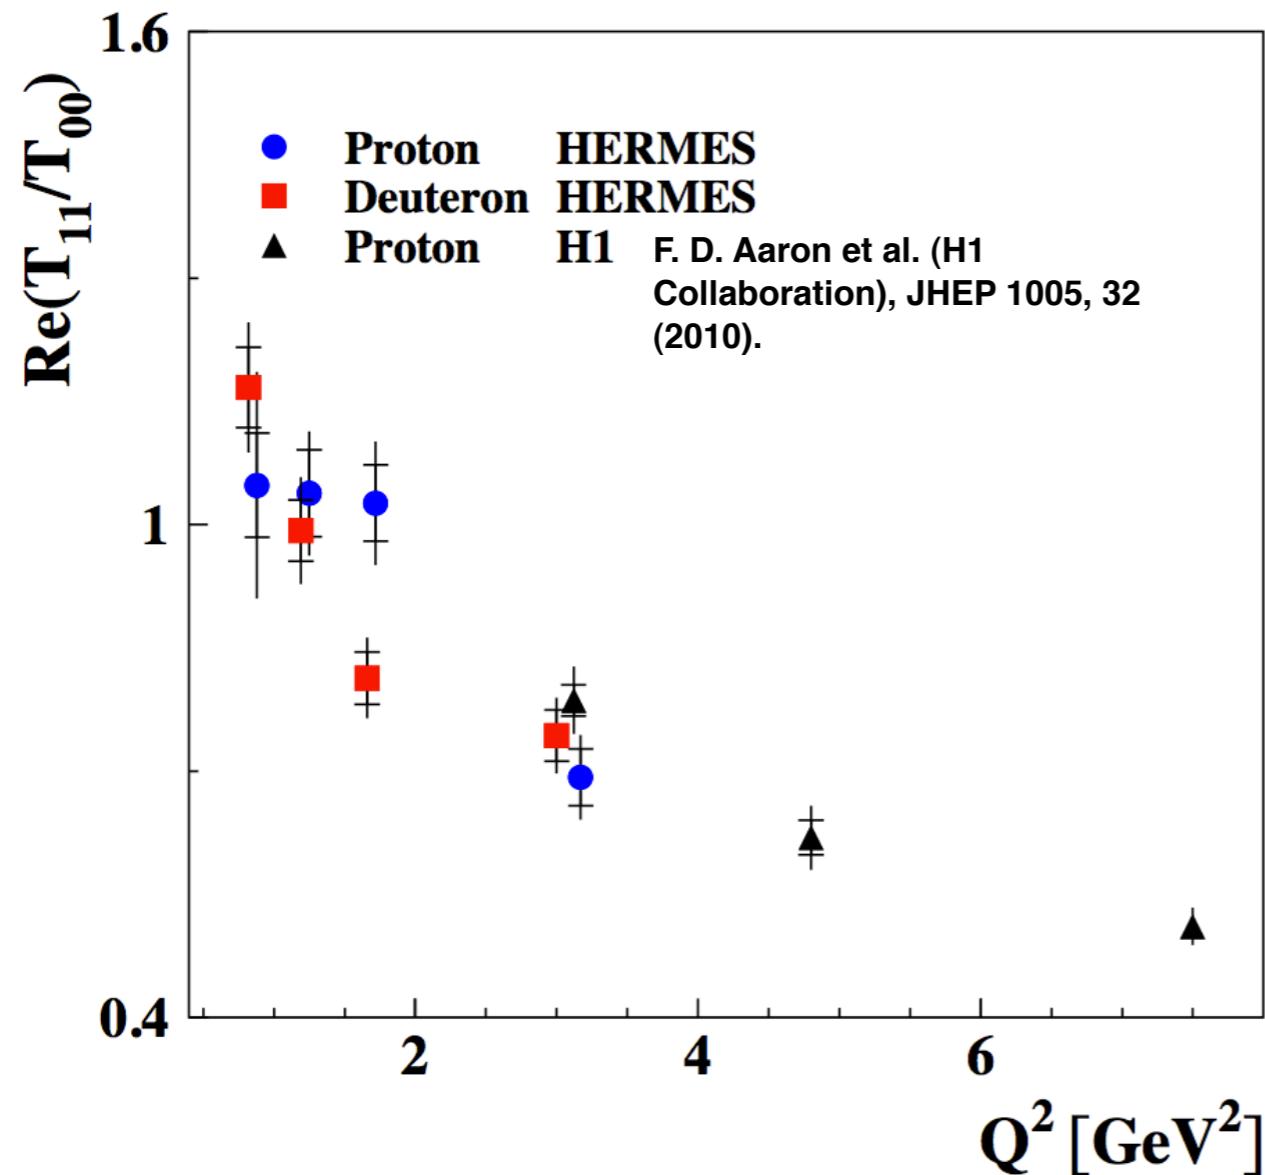

For unpolarized target and longitudinally polarized beam:

$$\begin{aligned} W^{LU}(\Phi, \phi, \cos\theta) = & \frac{3}{8\pi^2} P_{Beam} \left[\sqrt{1-\varepsilon^2} \left(\sqrt{2} \operatorname{Im} \left\{ r_{10}^3 \right\} \sin 2\theta \sin \phi + \operatorname{Im} \left\{ r_{1-1}^3 \right\} \sin^2 \theta \sin 2\phi \right) \right. \\ & + \sqrt{2\varepsilon(1-\varepsilon)} \cos \Phi \left(\sqrt{2} \operatorname{Im} \left\{ r_{10}^7 \right\} \sin 2\theta \sin \phi + \operatorname{Im} \left\{ r_{1-1}^7 \right\} \sin^2 \theta \sin 2\phi \right) \\ & \left. + \sqrt{2\varepsilon(1-\varepsilon)} \sin \Phi \left(\textcolor{red}{r}_{11}^8 \sin^2 \theta + \textcolor{red}{r}_{00}^8 \cos^2 \theta - \sqrt{2} \operatorname{Re} \left\{ r_{10}^8 \right\} \sin 2\theta \cos \phi - \textcolor{red}{r}_{1-1}^8 \sin^2 \theta \cos 2\phi \right) \right] \end{aligned}$$

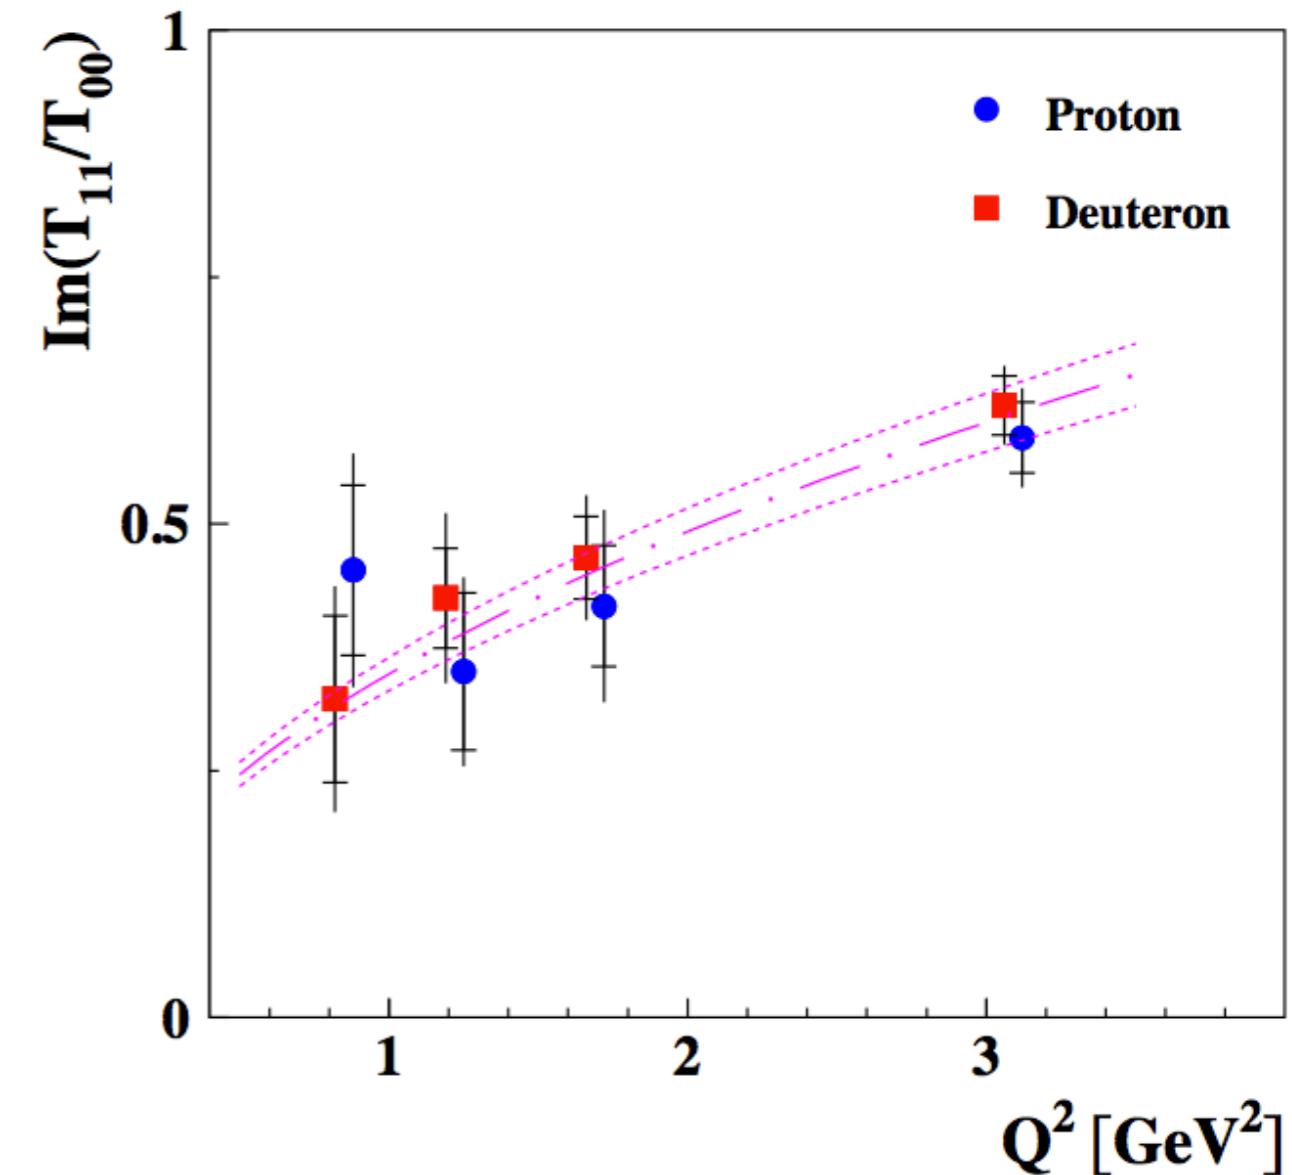

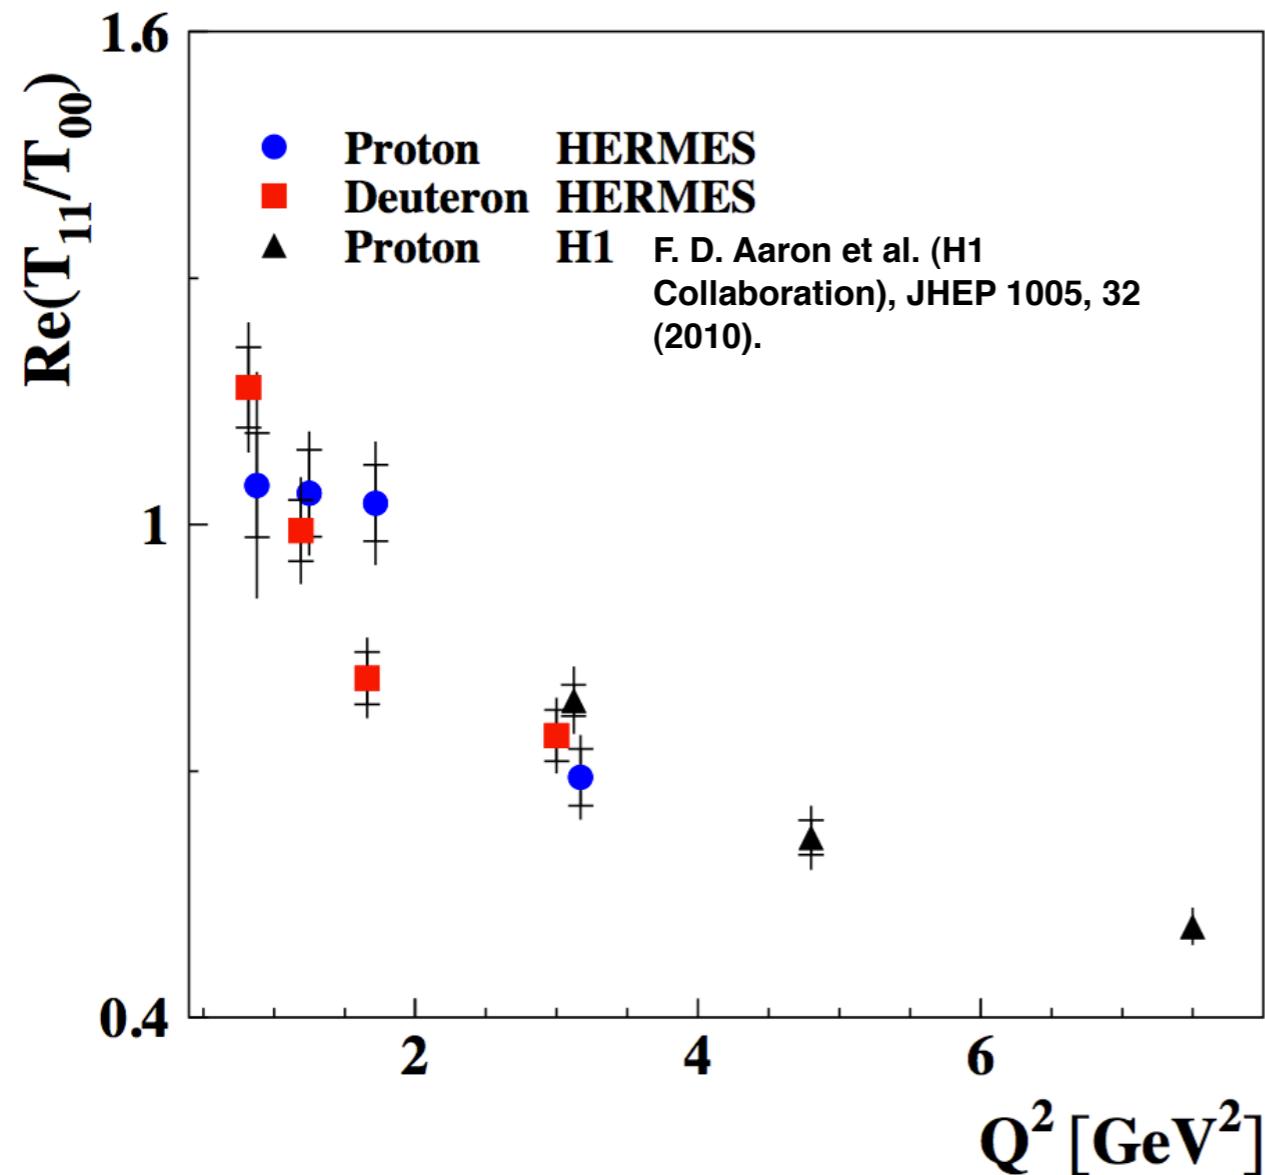

$$\varepsilon = \frac{1 - y - y^2 \frac{Q^2}{4v^2}}{1 - y + \frac{1}{4} y^2 (\frac{Q^2}{v^2} + 2)} \quad \begin{array}{l} \text{- the ratio of virtual photon fluxes for longitudinal and} \\ \text{transverse polarization} \end{array}$$

Exclusive Measurement

Kinematic Dependence of t_{11}

Real Part follows a/Q
with $a=1.11 \pm 0.03 \text{ GeV}$
as expected!

Imaginary Part follows bQ
with $b=0.34 \pm 0.02 \text{ GeV}^{-1}$
(fit has no basis in theory)

Phase Differences of HARs

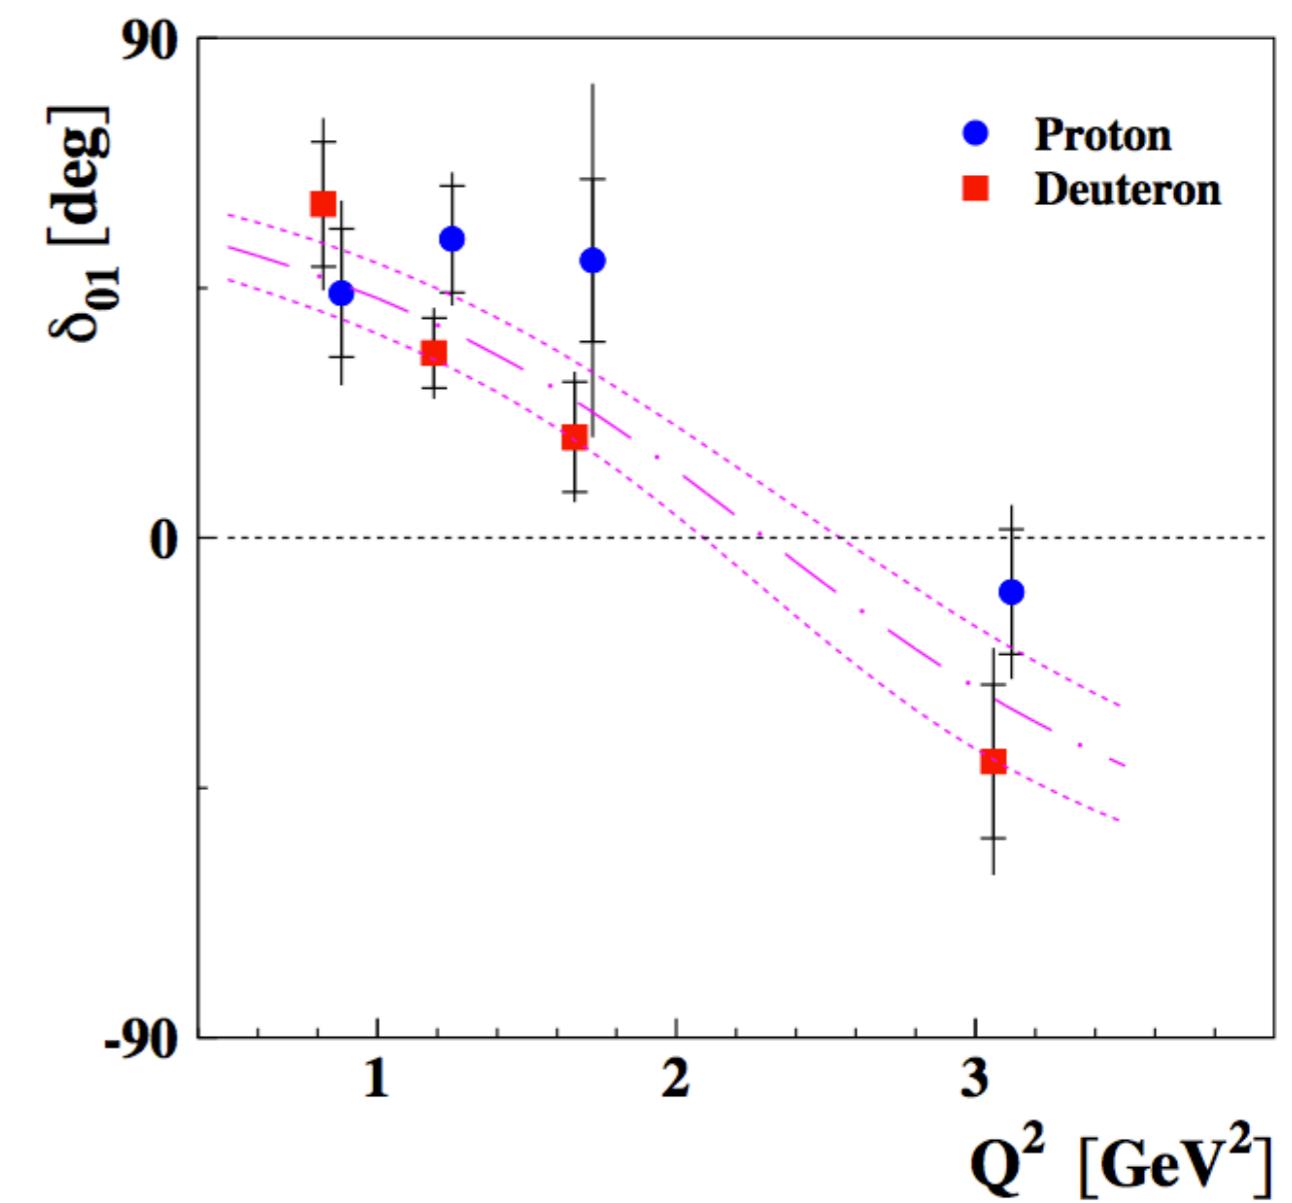

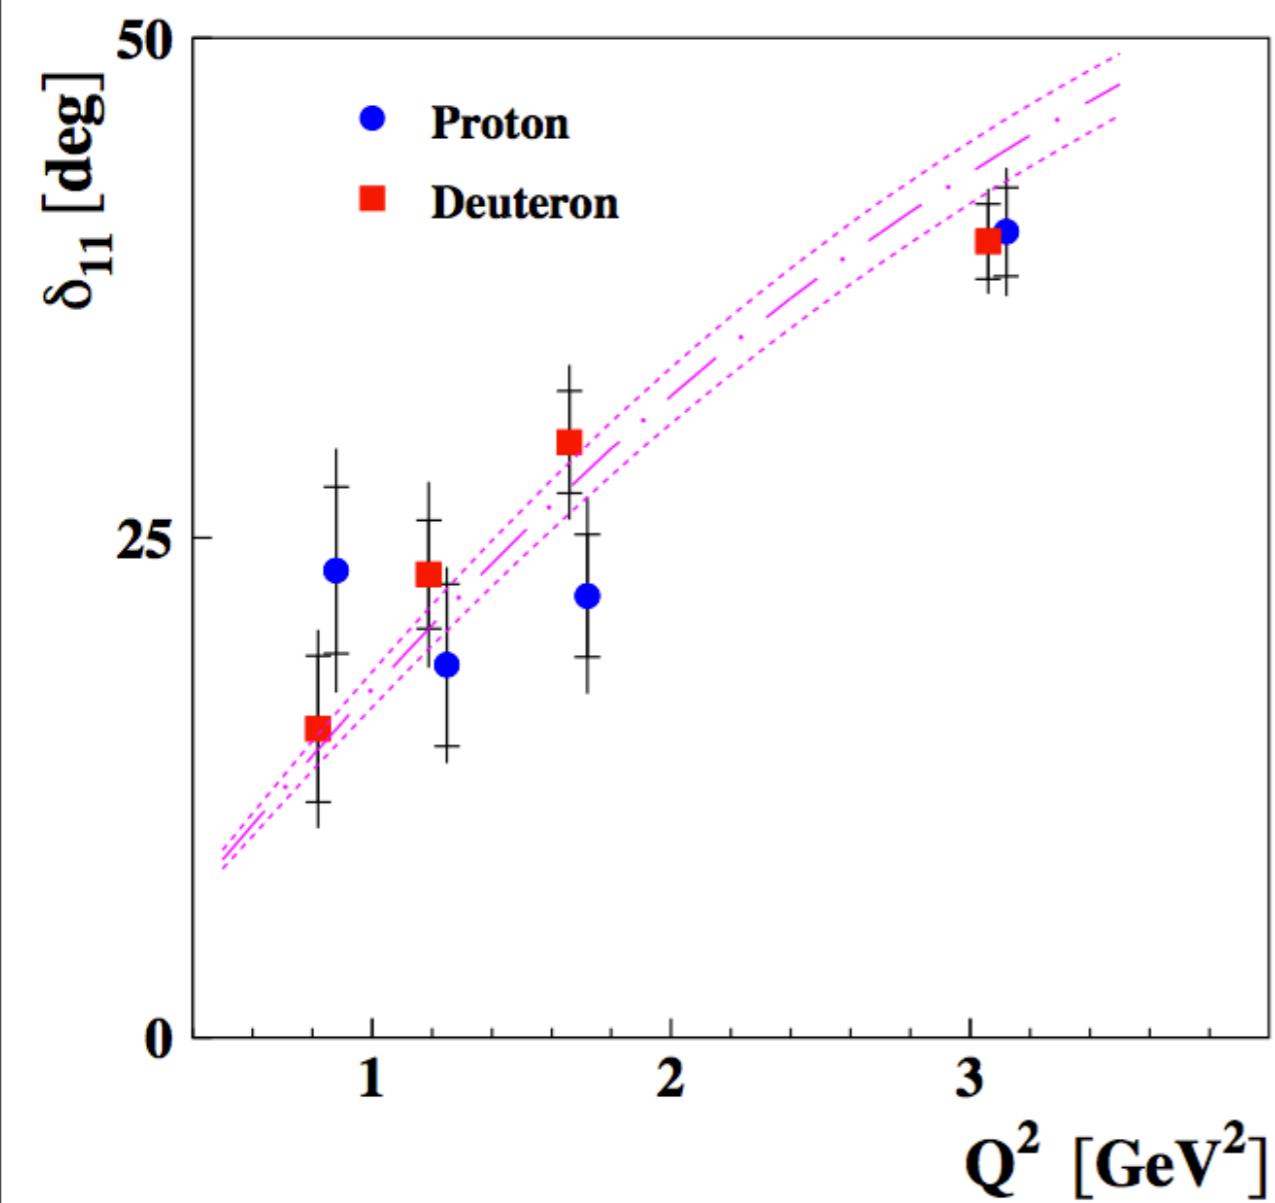

- GPD model predicts small phase difference for $\tan(\delta_{11}) = \text{Im}(t_{11})/\text{Re}(t_{11})$

[S. V. Goloskokov and P. Kroll,
Eur. Phys. J. C 53, 367 \(2008\)](#)

- t_{01} is expected to be the largest SCHC-violating amplitude and δ_{01} should be constant

[D. Yu. Ivanov and R. Kirschner,
Phys. Rev. D 58, 114026 \(1998\)](#)

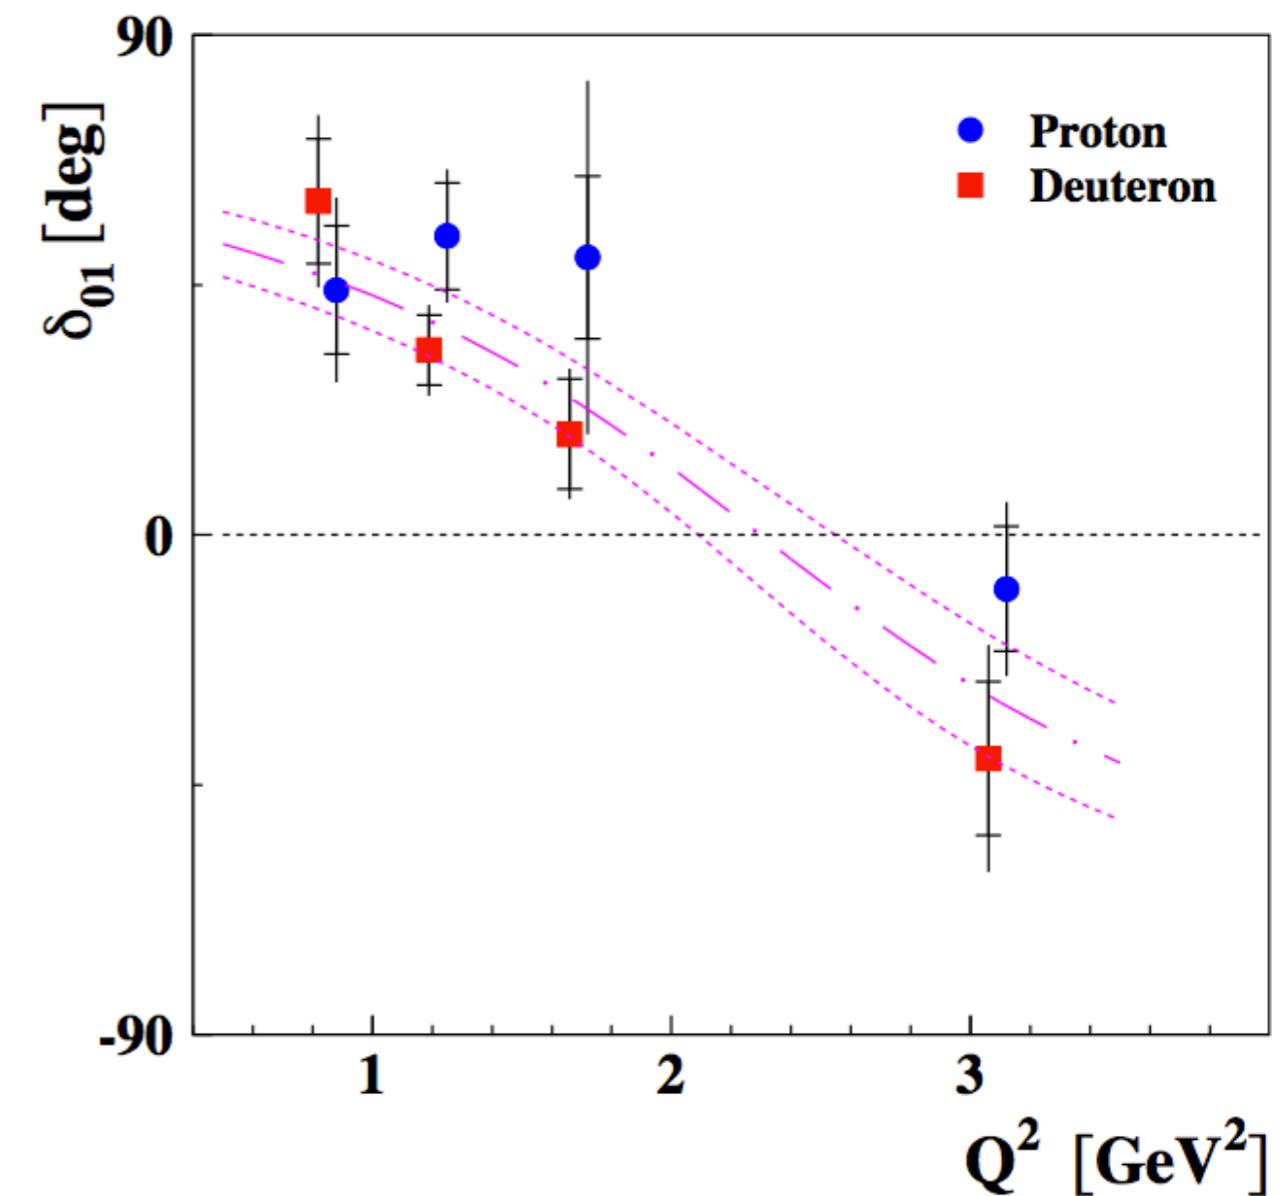

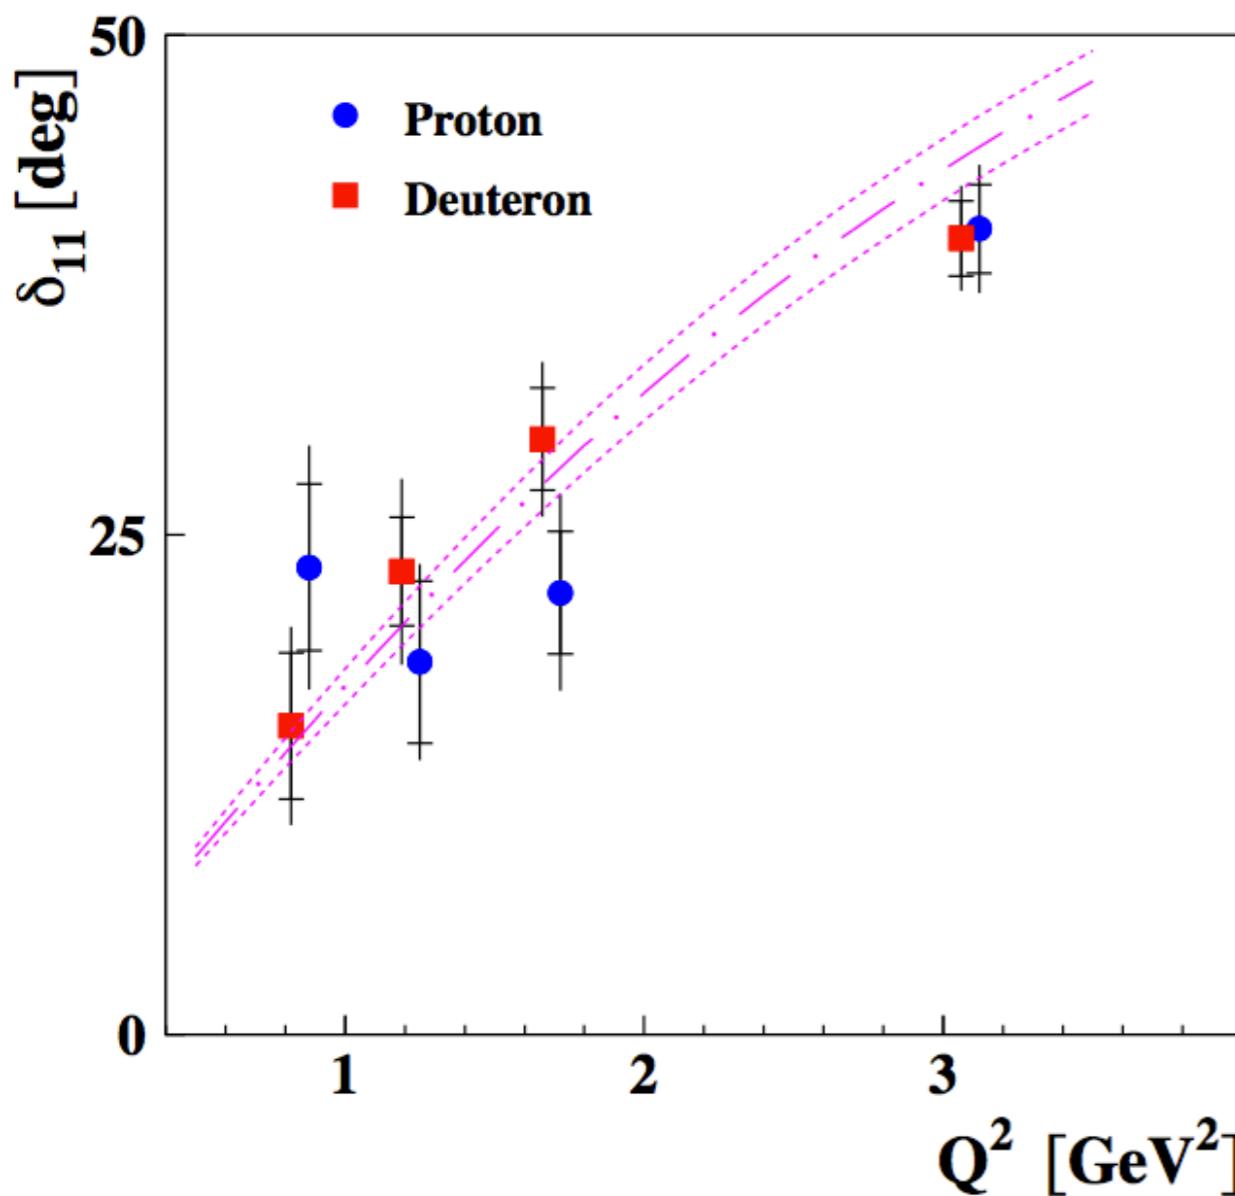

Phase Difference of HARs

Large value **contradicts**
GPD-based models

Should be a **constant**

(Neither $\text{Re}(t_{01})$ nor $\text{Im}(t_{01})$ follow theoretical dependence predictions!!!)

N.B: Fits have no basis in theory

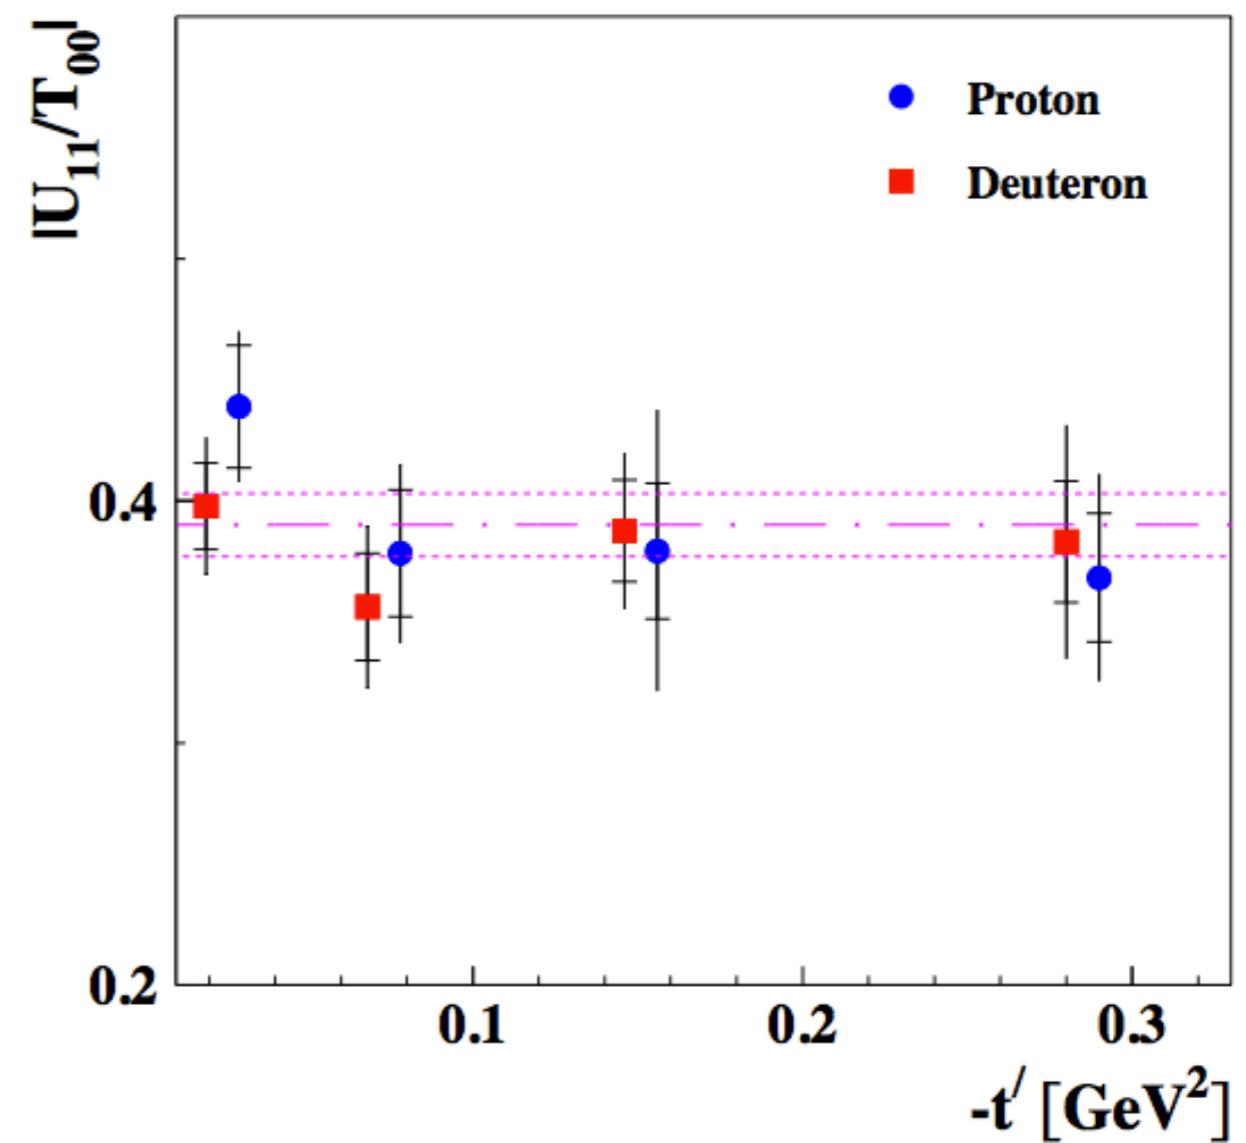

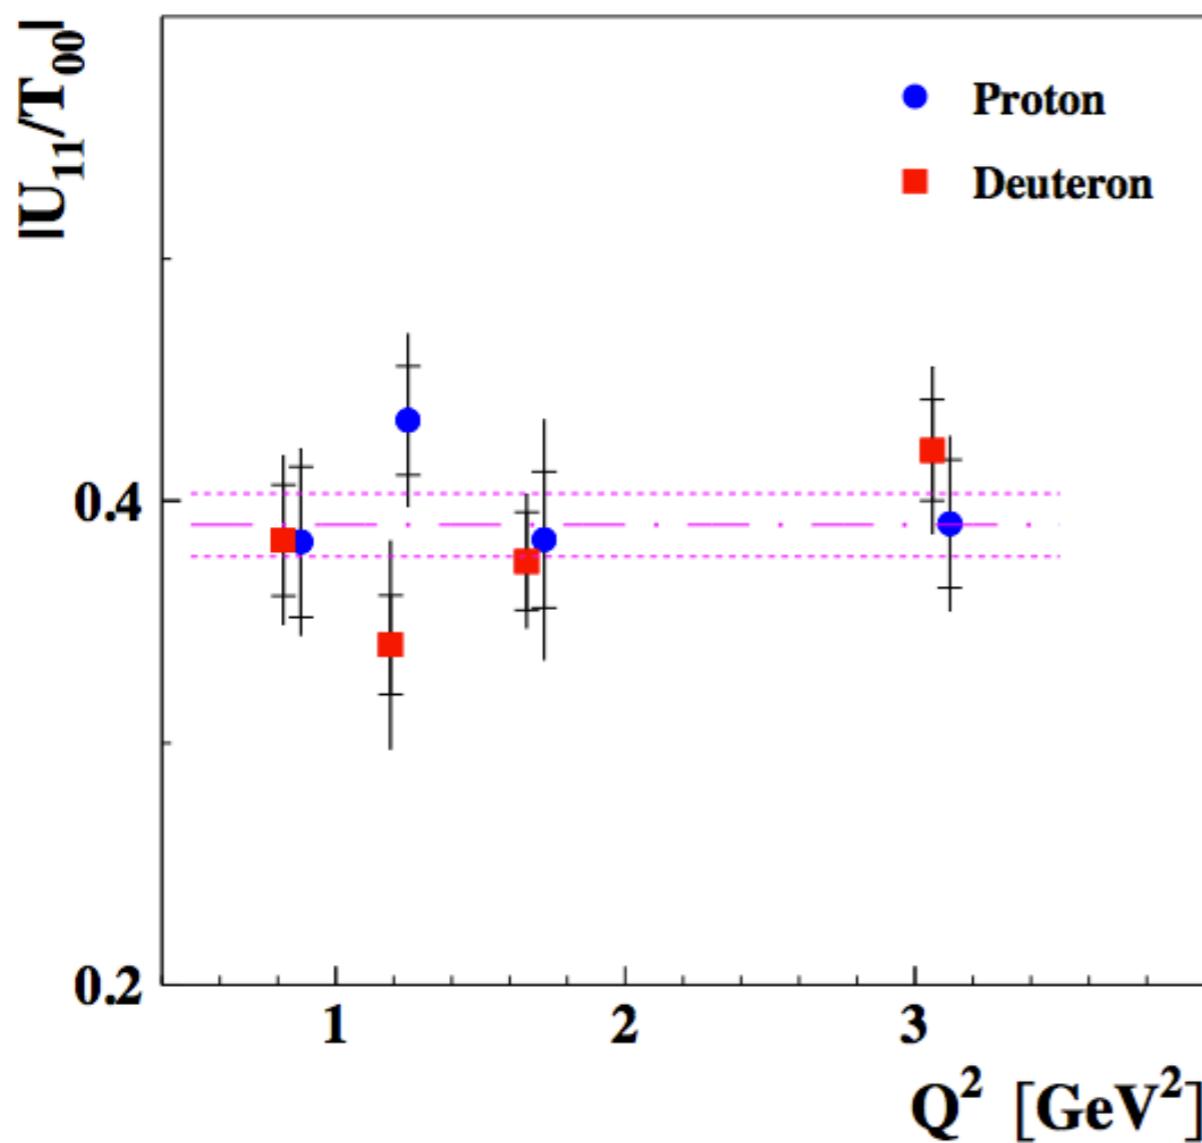

Helicity Amplitude Hierarchy

Behaviour of UPE

$$|T_{00}|^2 \approx |T_{11}|^2 \gg |U_{11}|^2 > |T_{01}|^2 \gg |T_{10}|^2 \dots$$

- $u_{11} = |U_{11}|/|T_{00}|$ should be small ($u_{11} \approx 0.2$) but **visible** (only) for ρ^0 at HERMES!
- May naively expect a I/Q dependence in u_{11}
- UPE is one-pion exchange => may also see some influence of the **pion-pole at small t ?**

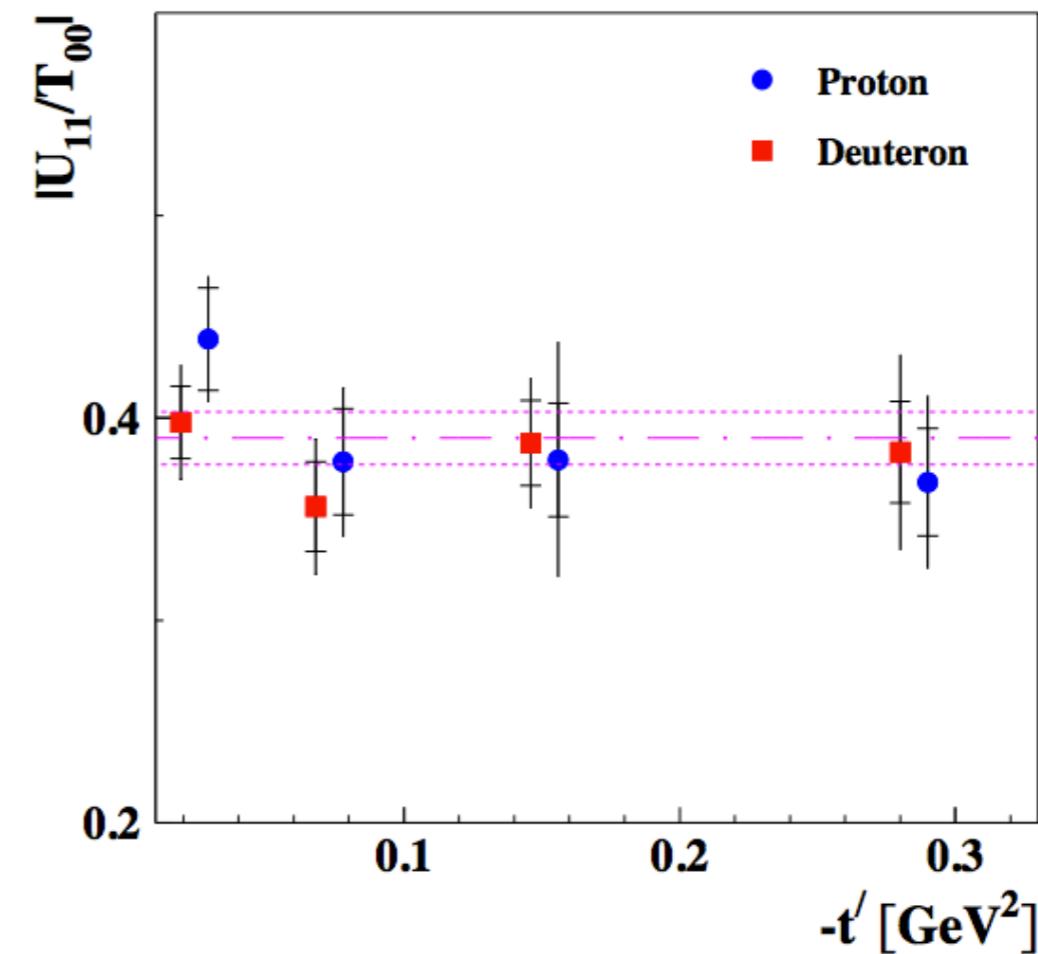

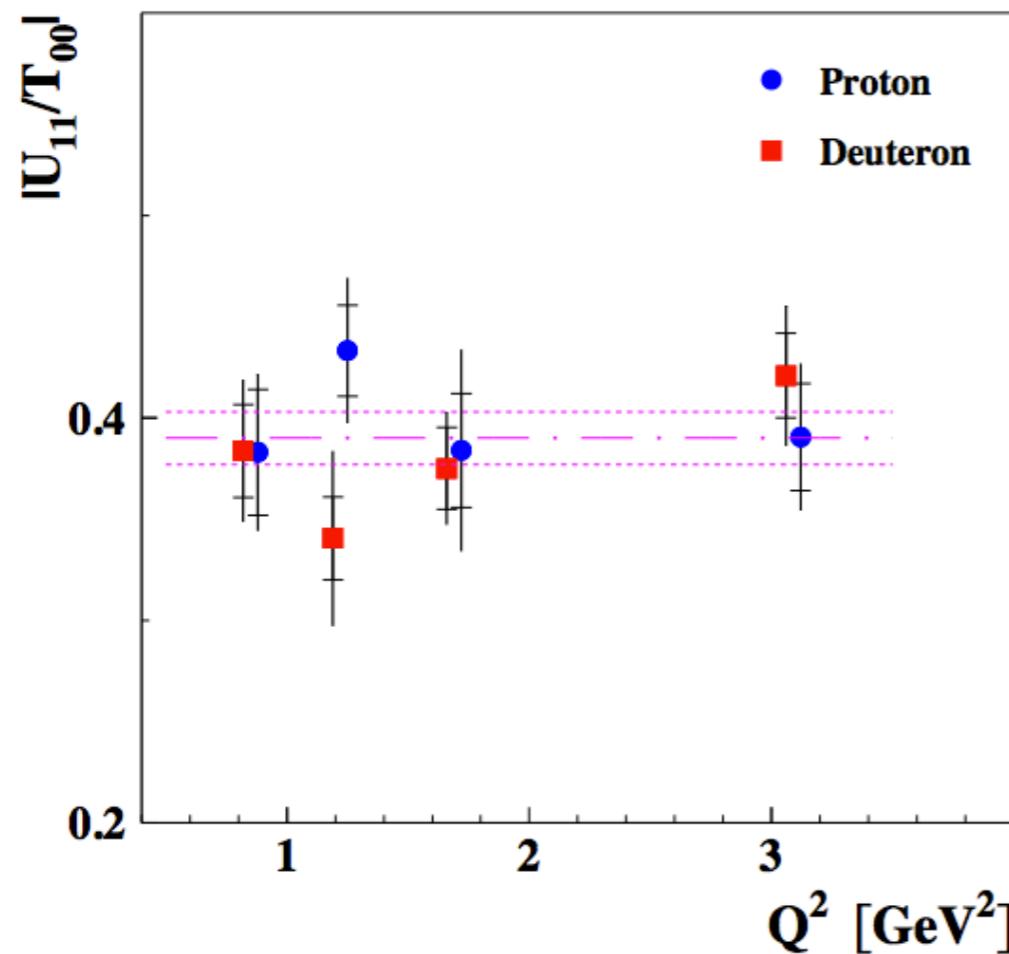

Unnatural Parity Exchange

Unnatural Parity Exchange

No dependence on $Q^2!$

No dependence on $t'!$

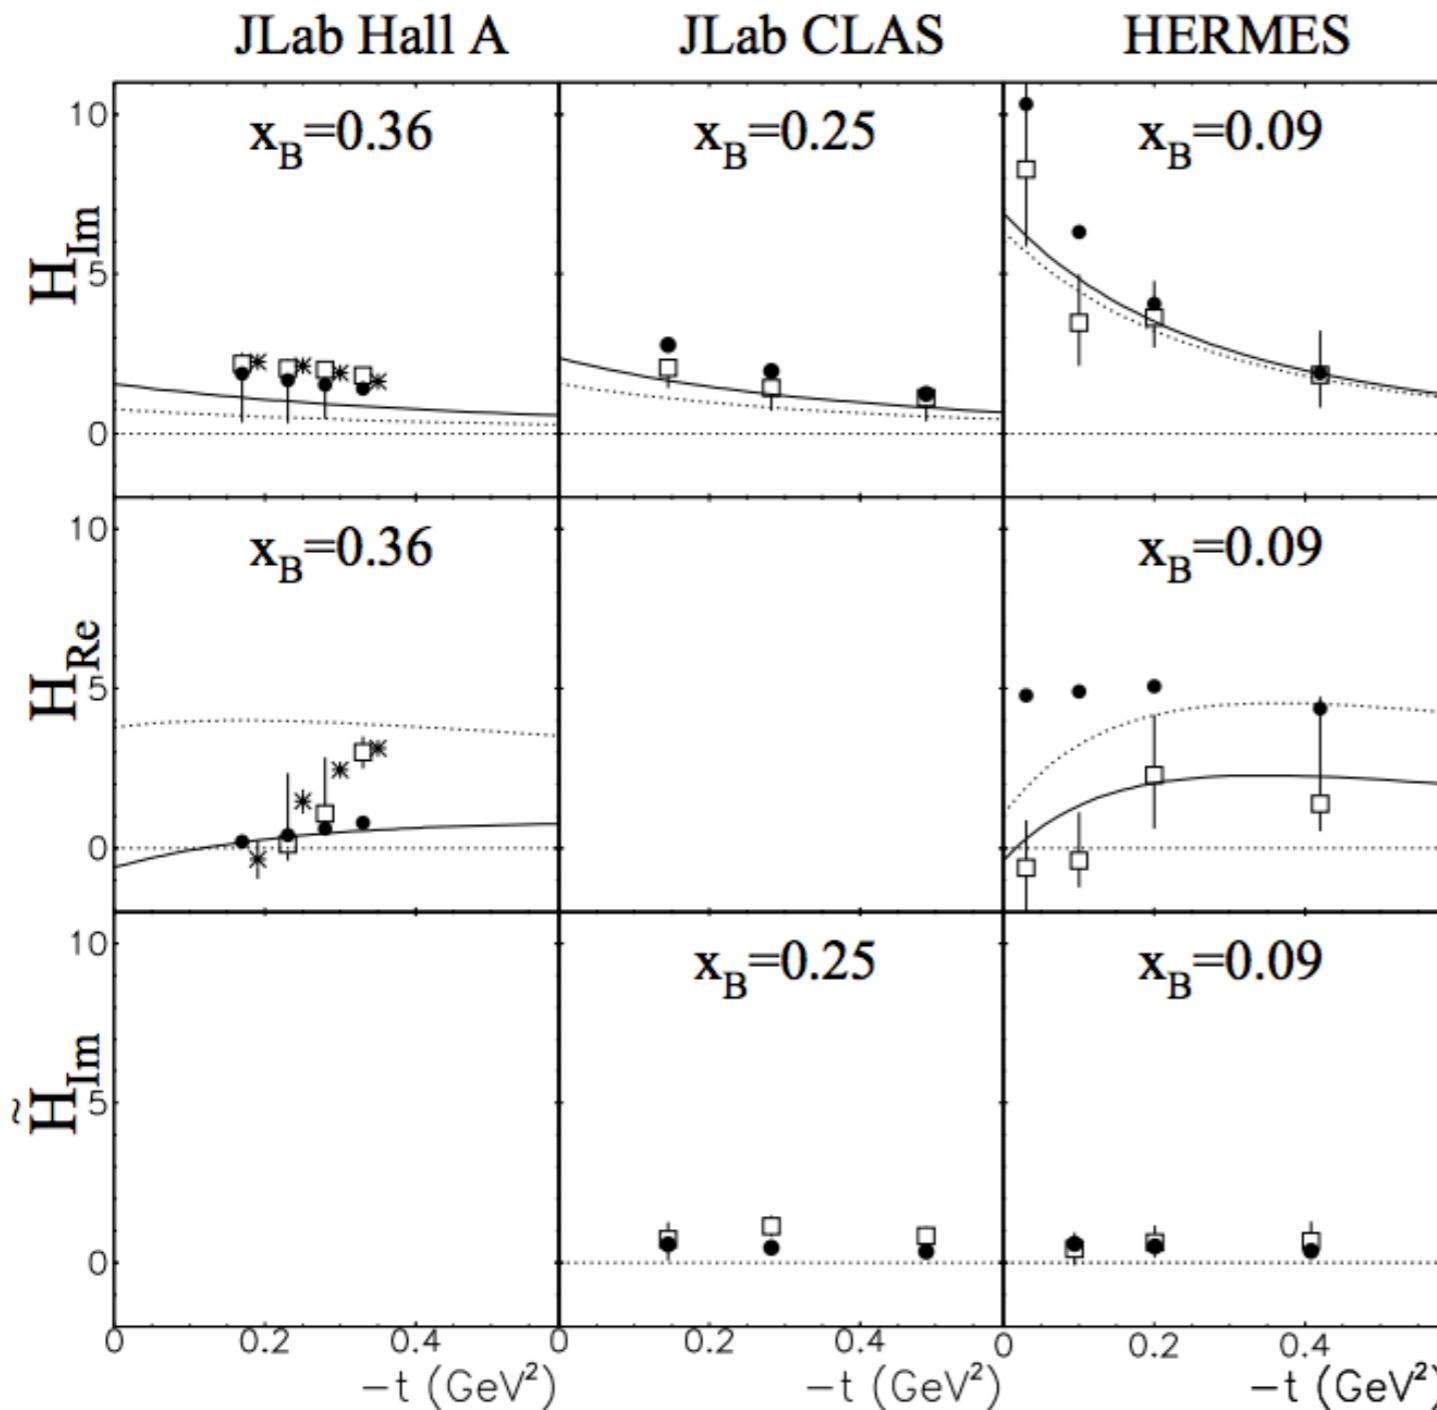

Existence established to 20σ (integrated extraction)
Magnitude of U_{11} is 2.5x smaller than T_{00}

Unnatural Parity Exchange

- No dependence on Q^2 may be because
HERMES is far from the asymptotic region ?
- No dependence on t'
 - **Too far** from pion-pole ?
 - **U_{11} not dominated** by one-pion exchange ?
 - An underlying dependence of T_{00} on t' ?

GPD Extraction

Even for H, VGG model
GPDs are shown **not to**
be consistent with
experimental
measurements when
CFFs are extracted from
data.
